THE SANITARY ENGINEER.

PUBLIC HEALTH · DRAINAGE · WATER SUPPLY · VENTILATION · HEATING · LIGHTING

Trade Mark registered in the Patent Office, Washington, D. C., February 12th, 1878.

VOLUME 7. *NUMBER 1.* | NEW YORK, DECEMBER 7, 1882. | *SINGLE COPIES 7 CENTS.* *Price of Single Copies more than one week old dependent on number on hand.*

Entered at the Post Office at New York, N. Y., as second-class matter.

THE SANITARY ENGINEER, *conducted by* HENRY C. MEYER, *is published every Thursday, at* 140 *William Street, New York. Its opinions upon all technical subjects are either prepared or revised by specialists.*

TERMS, $3 PER YEAR, IN ADVANCE.

Postage Paid.

OFFICE IN GREAT BRITAIN: 16 CHARING CROSS, LONDON.

E. & F. N. SPON, Agents.

TERMS 16*s.* 6*d.*, PER YEAR, IN ADVANCE. *Postage Paid.*

CONTINENTAL SUBSCRIPTIONS RECEIVED BY
F. A. BROCKHAUS, Esq., Querstrasse 29, Leipzig, Germany.
Subscriptions to the Continent of Europe and Australia, $4; China, Japan, Sandwich Islands, Mexico and Cuba, $4; South America, $5.

NOTE.

Persons in any of these countries can send us the subscription price, by calling at their Post Office and leaving with the official the equivalent in their own money, for which he will give them what is called a "Post Office Order," which, if enclosed to us will be paid by our Post Office, the same as a draft when presented by us.

Fractional parts of a dollar may be sent in postage stamps.

Subscribers will please notify us of any failure to receive the paper, and also of any change in their address.

For Advertising Rates see last page.

Entered according to Act of Congress in the year 1880, by HENRY C. MEYER, in the Office of the Librarian of Congress at Washington, D. C.

WITH SUPPLEMENT.

ADVERTISEMENTS 14-24

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

AN ANNOUNCEMENT.

At the commencement of the sixth year and seventh volume, the conductor of this journal publicly announces his connection with it. To many of its readers this connection has always been known—to the larger number it will be news.

Favorable circumstances have enabled him to retire from the care of other active interests, and he hopes in the future to be able to devote his time and thought to the journal which he has founded. In thus formally identifying himself with sanitary work, as exemplified in the conducting of THE SANITARY ENGINEER, he is gratifying his tastes and inclination, and yet is taking up an occupation sufficiently practical and remunerative to place it beyond the limits of a merely philanthropic enterprise.

He desires, on this occasion, to acknowledge the fact that to a corps of able and disinterested contributors and assistants much of the credit of the success of this journal is due, and that their advice has been a real help in ways that none but the writer can fully appreciate.

OUR FUTURE NATIONAL HEALTH ORGANIZATION.

No. III.

Referring to our previous editorials for a general statement of the situation, and for an explanation of the views of the Treasury Department, and of the Marine Hospital Service in particular, as to the control of Maritime quarantine, we come now to the position of the National Board of Health on these questions. To understand this position it is necessary to remember that the Board owes its existence to the resistance made by the American Public Health Association to the attempt made by the Marine Hospital Service in 1878-9, to secure control of quarantine matters. The Act creating the Board was passed in the face of the most strenuous opposition on the part of the Marine Hospital Service, and the only thing which it contained about quarantine was the direction that the Board should investigate the subject and report its conclusions. Those who urged the passage of the Act had much more faith in the possibility of promoting public health interests by investigations into the causes of disease, and by urging cleanliness, pure water, proper sewerage, etc., than they had in quarantine; and in fact subsequent events showed that some of them had placed too low an estimate on the value of quarantine inspections, especially against yellow fever.

After the Board had been in existence about two months, the present so-called Quarantine Act was passed. This directs the Board to *aid* State and local boards to enforce *their*, not *its*, regulations. So far as we can learn, the attitude of the Board towards this Act, while it was under discussion in Congress, was passive; it neither urged nor opposed it, although when formally consulted with regard to it, it suggested some modifications, and may therefore be considered to have given it a tacit approval. This Act is to remain in force only four years, and therefore expires next June.

It is not our purpose to give an account of the work of the Board; space being wanting for even the most condensed summary. It is sufficient to say that its operations under the original Act, have received the approval of all scientific men, sanitarians and physicians of the country, and that its work under the Quarantine Act is fully endorsed by the American Public Health Association, the Sanitary Council of the Mississippi Valley, and by every State and Local Board of Health or quarantine authority in the United States, with the exception of three only. The chief objector to the quarantine management of the National Board is the State Board of Health of Louisiana; and this is in part due to a personal quarrel, and in part to the fact that the revenue of the local board is mainly derived from the tax on vessels, which is collected at its quarantine establishment, and that therefore it is unwilling to make any change which would involve the diminution of its funds.

It is, however, our deliberate opinion that the hostility of the Louisiana Board, and the peculiar style in which it has been manifested, has, on the whole, rather helped than hurt the National Board. The great majority of the leading business and professional men of New Orleans as represented in the Citizens' Auxiliary Sanitary Association, the Medical Society, the Cotton Exchange, etc., condemn the position of the Louisiana Board in a very decided way, and approve that of the National Board.

But if the operations of the National Board meet with this very general approval on the part of those most competent to judge, how comes it that it has met with such hostile criticism in the daily press and in Congress? We have in part already explained this in describing the attitude of the Treasury Department, and of the Marine Hospital Service. The most influential opponent of the National Board has been, and no doubt is, Judge French, the Assistant Secretary of the Treasury; in fact, the supervisor of the Marine Hospital Service derives all his support from this source.

Judge French is a strong believer in a National Quarantine, and thinks that the United States should have charge of this service, by means of its own officers, in all ports; he believes that this should be under the entire control of the Treasury Department, and that the National Board is the result of an outburst of sentimental philanthropy, which has had its day, and should now give place to practical control of the matter by Government officials.

TA1 .E48

While the Secretary of the Treasury changes with the administration, the Assistant Secretary does not, and all matters relating to the National Board, as well as to the Marine Hospital Service, are decided by Judge French.

The cool or hostile attitude of the press, so far as we can learn, is in part due to the influence of the Treasury Department and the Marine Hospital Service, whose chief has never underrated the value of newspaper influence, and to the further fact that the late Secretary has offended some of that very influential body of men, the Washington correspondents, and has probably taken no special pains to conciliate any of them.

When to these causes we add the enmity of a few disappointed candidates for office, and the fact that the great majority of members of Congress are profoundly ignorant of and indifferent to the whole subject, and therefore follow blindly the lead of the Committee on Appropriations, which at present has at its head a special friend of the Treasury Department, the troubles of the National Board of Health are not so much to be wondered at.

Having thus briefly, but we hope with sufficient clearness, explained the situation, we will in our next number, consider what it is best to do about it.

THE STREETS OF NEW YORK.

The most busy streets in the lower parts of New York City have been for several months past in the hands of three private corporations, who have torn up the pavements and obstructed travel as it suited them. They have done their work, to be sure, in outward compliance with the forms of law, under the sanction of resolutions passed by the Common Council and of permits duly granted by the Department of Public Works. The work has been done presumably under the supervision of inspectors appointed by the municipal authorities, to see that no injury was done to the property of the city, and the workmen have been protected and the public interests guarded during the progress of the work by the city police. The interests of the companies themselves have been guarded by civil engineers of high reputation, and by inspectors who might be supposed to use every effort to protect their employers and the public from injury, expense, and inconvenience. Yet the whole operation has been bunglingly managed.

As regards the convenience of the public, who have the prior right to the free use of the streets, every one concerned seems to have ignored it entirely. The pavements of the most constantly used streets in the city have been torn up and replaced three times in succession to lay down three sets of pipes by three different companies, neither one of which apparently knew where the others had laid or proposed to lay their pipes, or had any definite ideas in advance of opening the trenches, what they proposed to do themselves. All this was bad enough in itself, but it is not the worst. In a number of places the streets have been torn up to correct defects in fittings and to discover the cause of imperfect insulation of the electric light wires, and there is every reason to apprehend that this nuisance will become chronic. The frequenters of the section of the city embraced within the present range of the steam heating and electric light companies will have to bear their discomforts as best they can. But before any extensions of the system are permitted, the owners of property will do well to demand certain radical changes in the methods pursued.

At the very root of the whole evil is the vile system of patronage, political and social. In every company which procures a franchise to occupy the streets the services of some influential professional politicians are secured. The support of some contractor of means and political influence is also obtained. It is not always necessary to pay out hard cash to public officers to secure favorable consideration, but in most instances a pledging of a share of the patronage is indispensable. That is to say, it must be understood that certain mechanics, laborers, inspectors, overseers, watchmen and so forth, shall be employed and retained on the work whether their services are valuable or not. There is a large multitude of such men in the city of New York, whose votes and tongues, and sometimes fists, are valuable to the petty politician, and to him they look for support. Those men will not do good work even when they know how to. Their employer dare not discharge them even when he knows they cost him more than they are worth, for their discharge would bring down on his head the wrath of a succession of men of "influoence," and the result would be—no more contracts. There is not in the city of New York a single foreman, contractor, inspector, civil engineer or head of a department, who can deny that this is true, and that he has under his control, nominally, men whom he knows to be inefficient or negligent, but whom he dare not remove, or hardly reprove. It goes down the whole scale from the top to the bottom. The result is bad work somewhere, in spite of every effort of the conscientious, faithful, earnest workers.

The worst specimens of the "dead beat" are found among too many of the inspectors appointed by the city departments. A contractor's employés are not to be expected to do their best work at all times. They have no special interest in the work. A contractor cannot be expected to be very strict in requiring perfection, if it costs a little more and what is done will pass the inspector. But the inspector should be capable, honest and efficient, and subject only to the engineer. A broken-down mechanic or a political bummer is not fit for such a position. Everybody will acknowledge this, in the abstract, and yet such men constitute a majority of the appointees of any city department as inspectors of public works.

Now we venture to say that if Mr. Buel and Mr. Emory, the Engineers-in-Chief of the two steam heating companies, had been given, as they should have been, full charge of the work of fitting and laying the pipes, with absolute authority to remove at once any man detected in slighting his work, and to appoint and discharge inspectors, there would have been no settlement of pavements, and very little blowing out of joints. It is all nonsense to talk of the impossibility of refilling trenches so that pavements will not settle. It can be done, it has been done, and it should be done every time. It would be done if a contractor was fined fifty dollars for every settlement after he left the work.

The companies should also be required to act in concert, to prepare beforehand plans of their proposed structures, and to put them in all at the same time in the same block. There need be no difficulty about this. It would save time in the end, and save money, not to speak of the inconveniences to the public. We believe that the three companies now engaged in ruining the tempers and injuring the property of the people in the down town streets, would have wasted less of their money if they had agreed to work together, and have taken up the streets section by section, and put their pipes and those they found in a subway of masonry. As it is, their operations have made them a public nuisance, and though it may be true that the New York Company has met with fewer accidents and has incurred a greater expense in order to reduce to a minimum the mishaps that seem inevitable even under the best management, and admitting that the engineers of the American Company have been forced to adopt cheaper methods of construction, and let the work out to sub-contractors, in order to bring the expenditures within a limit to satisfy investors, and that most of the mishaps thus far have been with their pipes, yet the public will not discriminate so long as they feel outraged.

The question now arises, what is to be done? The facts are, that in addition to the repeated digging up, in order to get at the present pipes to which New Yorkers will have from time to time to submit, we are certain to have more steam and electric light companies organized if these ventures prove profitable, or if speculators think they can float a company on a plausible prospectus. Notwithstanding the fact that there are three sets of gas pipes in some streets, another company is asking the authorities for permission to lay down still another line of gas mains. It is, therefore, high time to cry a halt, and if the authority does not now exist, a legislative enactment should be procured this winter, providing for placing under suitable restrictions and conditions, in properly constructed brick subways, all pipes to be hereafter laid. Until such a provision is made, and this pipe-laying can be done in some rational, comprehensive manner, not another length of it should be allowed to be placed under our streets. We commend this suggestion to the Committee of Twenty-one.

MORE DANGEROUS WORK.

In the year 1878 public attention was called to the character of the plumbing contained in some apartment houses situated in East 52d street in this city. Through the efforts of Doctor T. G. Thomas, several of whose patients, living in one of these houses, had been ill with diphtheria and one or more of whom had died of that disease, an investigation was made of their sanitary condition and appliances.

The notorious Charles A. Budenseick was the builder of them, and the contracting plumber was Charles D. Lamarche, of No. 254 East 74th street.

Budenseick published an affidavit made by Lamarche, in which he stated that the plumbing had been done in a thorough, sufficient, and workmanlike manner in these houses, and we ventured the comment that had Lamarche sworn he had done as much work as he could afford to do for the price paid by Budenseick we should have been inclined to believe him, but under all the circumstances we could reach only the conclusion that Lamarche was either guilty of most rascally work in the plumbing of these houses, or was entirely ignorant of what constituted efficient sanitary plumbing, and, upon either horn of the dilemma, he should not be permitted to do plumbing work in this city and that his license should be revoked forthwith.

Budenseick was indicted under the Sanitary Code for this work, and was tried in Feb., 1880, but under the law as it then existed criminality could not be fastened upon him.

Lamarche working for this same Budenseick has recently come into similar notoriety again, and in view of the antecedents of these two men their practices demand some public consideration.

Our representative, in verifying the report of one of the health inspectors regarding the violations of the new sanitary and plumbing law, discovered some dangerous work done in the five apartment houses, No. 286 to 294 East 97th Street, in this city. Budenseick was the builder and Lamarche the plumber, and we are informed by the present owner that the plumber had agreed to do his work strictly in accordance with the regulations of the Board of Health, but how near this standard was attained may be learned from the following description of the sanitary arrangements in these houses.

"The traps of the closets and sinks on the top floor were not ventilated. Those on the floors below were ventilated into 2-inch iron pipes running up in the partition wall alongside the soil pipes, which they enter above the highest fixtures. Just below the junction of the air and soil pipes, and just beneath the level of the water closet seat, is a double T, thus, on the air pipe (presumed to have been left to receive vents from the closet and sink traps). The closet and sink are separated by the partition in which the soil and air pipes run. The sink is in a living room, and the closet in a small room at the end of the hall, with a window behind it, to the open air. In

Digitized by Google

every house the hub of the air pipe entering the space under the closet was open, and the opposite hub opened into the enclosed space under the sink in three of the five cases. In the other two, where the houses were occupied, the opening into the living room had been closed by plaster. The safes under the closets were simply sheets of lead with the edges turned up, but not soldered. In one case the closet had been leaking into the safe and the water had escaped into the space between the floor and ceiling below at a place where the edge had been turned down. In this house the occupant said there was a constant dropping through the night of water from the cistern overflow which discharged over the kitchen sink. In another house, the flushing apparatus (a valve on the closet supplied from an ordinary small cistern) was not in working order, and the smell was very offensive from the opening into the vent pipe. With some difficulty the flushing was made to work, and then it would not stop, though the valve rod was in the position in which it should be closed."

The only water closet trap our representative was able to see was connected to the Y branch by being run inside of what seemed to be an iron ferrule, no solder being used.

From the testimony at the trial of Budenseick, it appeared that Lamarche employed men to do plumbing work who were utterly incompetent. From the statements of the Inspectors in whose districts he now carries on operations, his record is that of a man who does 'skin work." There is no shadow of doubt that he is a conspicuous example of the class of men who take large contracts from the Budenseick class of builders, and speculate on the extent to which they can skin a job and not get caught by the Inspectors; and when caught, simply do what they are obliged to. We think, therefore, when the Board of Health are causing the work of a man, with a reputation such as that of Lamarche or Budenseick, to be inspected, their duty can only be fully performed when the covered work is as carefully examined as that which is uncovered; and that in this particular instance, the casings should be removed and the entire plumbing work disclosed in every one of the numerous houses in which recently Lamarche has been the contracting plumber and Budenseick the builder, whether in their own name, or in that of some other party. Hitherto, the Board having shown a disposition to be lenient, their Inspectors very naturally have been reluctant to destroy casings and uncover work, and have undoubtedly, as in dealing with men of good reputation, taken some things for granted.

If the Board propose to allow men of this character to do plumbing in this city, their Inspectors must be able to vouch for the soundness of every foot of work done. It will, indeed, be a crying shame if the experience of the East 52d street houses must be repeated before such a survey is made, as the safety of the future occupants of these houses makes imperative. In this connection we invite attention to the illustration of dangerous work discovered in Washington by the Plumbing Inspector of that city, whose report we elsewhere print.

THE SEWERAGE OF BRIGHTON.

The London *Lancet* of November 4 contains a long report by Dr. B. W. Richardson upon the sanitary condition of Brighton, concerning which there has been much controversy during the past summer. Dr. Richardson was employed by the town authorities, who, of course, desired a favorable report, and from the number of persons and institutions eulogized it is evident that the good-natured Doctor has done his best to please his clients. He concludes that the unusually high mortality of Brighton during the first half of the present year was due to measles, scarlet fever and whooping cough, to which should be added an undue prevalence of typhoid fever in 1881. This last he finds to have been mainly due to a contaminated milk supply. The undue prevalence of the other diseases named, he thinks, was due to the fact that for about eleven years the town had been unusually free from these diseases, thus allowing time for the birth and growth of a large population, unprotected by previous attacks, and therefore susceptible to their influence. He concludes that Brighton is singularly free from the influences of sewer air, and his line of argument will be found extremely useful by those municipal authorities who have to defend the reputation for healthfulness of their respective localities, no matter what the facts may be. For instance, he investigated a case of diphtheria, and gives the result as follows:

"She was believed to have been exposed to a bad odor from the ventilator of a sewer, but I found the most contradictory statements as to the character of the odor, and even as to the existence or non existence of an odor. Further, although I was informed that five cases of sore throat had occurred some weeks before in the same house. I could trace no other case of diphtheria in any other house near the ventilator. * * * I have seen so many cases of diphtheria, in children predisposed to the disease, coming on from cold after exposure to fatigue and wet without any suspicion of exposure to sewer air that," etc., etc.

Evidently it would have taken a good deal to have satisfied Dr. Richardson that anything was due to sewer air in Brighton.

He states very emphatically his preference for the separate system of sewerage, but as Brighton has the combined system he has softened his objections to it into the following very tepid statement. "The angers presumed to be attendant upon the present system are," etc. "It is assumed that the sewer gas will escape." If Dr. Richardson had been speaking from an entirely independent stand-point we do not think he would have put it in this way.

But while this report, as regards the actual condition of Brighton, can only be considered as a piece of special pleading, some of his recommendations are suggestive and valuable. Among these we note the following:

"3. I should carry out the medical officer's suggestion to establish in the eastern and western parts of the town a mortuary, so that the dead in the smaller and crowded tenements of the living may be immediately removed. Connected with these mortuaries I should build a court room for the service of the coroner in his judicial investigations.

"4. In four different parts of the town I should erect a series of workmen's workrooms, in which no family should be allowed to live, but in which any person engaged in indoor work, such as tailoring, shoemaking, and the like, should be able under proper supervision, to hire a workroom for a small sum per week. By this means the dissemination of disease by clothes and other articles made in rooms where the sick, dying and dead are lying would be prevented.

"5. The present public baths, established some years ago on the recommendation of Mr. Councillor Wood, are performing a most important service, and, as I found on inspection, are admirably carried out, and are doing an excellent business. They are, however, altogether inadequate for the wants of the town. I should extend these fourfold at least. The temptation they offer for personal cleansing extends to cleanliness all round—in clothing, in cooking utensils, in the house, in the mind. I am quite certain that this one further improvement would reduce the annual mortality another one in the 1,000 in Brighton.

"6. In connection with the baths I should build wash-houses and public laundries. The present system of laundry work in Brighton is not so bad as it is in many towns, for, as described in a preceding page, there are two good semi-public laundries. At the Grand Hotel there is also a model laundry in which an inquirer, if he be as favored as I was by the managers there, may see the perfection of rapid washing, drying, ironing, mangling, and folding of every variety of clothing. This would be the model of the public laundries; and if they were erected another source of danger always imminent—namely, the conveyance of the poisons of disease by infected clothing would be prevented. In each of these establishments a heat disinfecting chamber for the reception of dangerous clothing would readily find its place and would be of persistent usefulness.

"7. I should second most earnestly the recommendation of Dr. Taaffe for the erection in the town, in such portions as he would know to be best, of small public lavatories and water closet conveniences for passengers of both sexes on what is known as the châlet principle. These conveniences would be essentially healthful, and would more than pay for their own cost and maintenance.

"I should recommend the removal of all the cowsheds from the town itself, and until they can be replaced by model farm dairies, should reduce them largely in number, place them outside the town, and have them so convenient for inspection that they can be under constant surveillance. In all the milk stores I should also insist that the constant water supply was laid on. That a reduction in mortality would follow these improvements in the town of Brighton is absolutely certain. The typhoid milk epidemic of last year is a sufficient intimation of itself on this matter. It is not in the least a sanguine view to estimate that another saving of one life in the 1,000 annually would reward this important change in the present system, besides giving the assurance to the world at large that in Brighton, a town of schools, the young who go there would have in the purest form the most common and important food for the springtime of life."

A further recommendation "to enormously increase the present ventilation" to the road surface by additional man-holes, to be arranged also as flushing shafts, is good. If this suggestion is carried out we think a following one, namely to trap the higher sewers from the lower ones, would be of no benefit, and might, in fact, cause trouble from deposits, obstructions to the flow, and in storms form undue air pressure unless these traps are properly ventilated. He also recommends pumping the sewage at Roedean furnace from the Brighton section of the sewer, at high tide, directly into the sea. To do this would place the discharge of much of the sewage more than two miles nearer the town than at present. We think a better plan would be to pump it into the Portobello section of the intercepting sewer itself, shutting down the necessary penstocks, and thus, under a slight pressure, which could not be objectionable, discharge at Portobello freely at all times.

However pleasing to the people of Brighton this report will be, and notwithstanding its valuable suggestions, we are of the opinion that it will ultimately prove an unfortunate one, if steps are not at once taken to remedy the grave defects in the sewerage system admitted by Sir Joseph Bazalgette, and which are known to exist.

A writer in the London *Lancet*, in an article on "Canadian and American Hotels," warns his countrymen against the danger of a lengthened stay in our hotels. He says:

"With few exceptions, these hotels have fixed wash-basins, with hot and cold water laid on, in the majority of the bedrooms, and very frequently a bath and other convenience in addition. In the private houses of wealthy Americans, who are favorable to luxurious living, this same system is almost universal. An examination of many of these basins and of the plumbing arrangements has brought to light the fact that they are frequently untrapped, and that when traps are used, they are of a bad pattern, and calculated to create danger to the health of the occupant of any room or house where they are placed. A few weeks ago, a correspondent of *The Lancet* was placed in a bedroom where there was a fixed basin which communicated directly with the sewer without any intervening trap. He was made seriously ill by sleeping one night in this room with the windows wide open; and although he placed the plug in the basin and filled it with water, the whole of the water was sucked out through the waste pipe during the night, and the room filled with sewer gas. At the end of September another visitor was equally poisoned, and he found the waiters in the dining-room engaged in making a careful search for an escape of sewer gas, which was painfully apparent in that apartment. Remonstrance at the office of the hotel elicited the remark from the clerk in charge that he feared the sewage must have bubbled over again, but he was unaware that the basin was untrapped. Inquiry showed it was the common report that in some cases the sewage had forced its way into the basins in the bedrooms. It is not too much to say that it is dangerous for any adult to reside in an hotel with such imperfect sanitary arrangements, and that the air of the room would not improbably cause death to a delicate child. In very many hotels in America and Canada, bottle or cesspool traps are used under the basins, in which the sewage ferments, and so sewer gas is liable to be generated in every room which has a fixed basin. We must warn travelers to be careful before retiring to bed or remaining for any length of time in an hotel where the arrangements are as we have described. It would be a public service for one of our contemporaries in America to fearlessly expose this great danger to the public health."

There is no doubt that the condition of many of our oldest hotels is as above stated. We must,

Digitized by Google

however, be permitted to doubt the wonderful phenomenon of the water in a wash basin being sucked through the stopper, or overflow holes, by a syphoning action in the waste pipe. A force competent to do this would have bent the faucets or sucked them off the slab. It is more likely that the stopper used in that particular basin came from an assortment generally kept by the so-called hotel plumber, which rarely fit the socket, and the water leaked out. The rest of the indictment our hotels may have to plead guilty to ; but this one is too much.

The Board of Health of this city have approved an amended form of plumbing specifications. This, with our page of patents and an illustrated article describing the Edison system of wiring the Mills' building for their incandescent light, has been crowded out of this issue and will appear in our next.

SANITARY ARRANGEMENTS IN THE RESIDENCE OF MR. CORNELIUS VANDERBILT.

(Continued from VOL. VI., page 535.)

IV.—PLUMBING WORK IN THE KITCHEN.

The kitchen in this house contains a large amount of plumbing work. In it, or connected with it, are some features peculiar to this place, or at least such as we have not before described.

An account of these will, we think, be interesting to our plumbing readers. The sketch on the opposite page shows the arrangement of the greater part of the work. One of the most striking peculiarities seen in it is the location of

FIGURE 1.

the range. Instead of being placed against the wall between brick piers, under the chimney or very near it, it stands out in the room two feet or more from the wall behind, and at a considerable further distance from the chimney, which is on the right hand beyond the end of the range.

Another novel feature is the method of supporting the horizontal boilers. They are usually suspended from the ceiling, but here they are supported from the floor, resting in nickel plated iron frames of an ornamental pattern shown in Fig 1. The boilers—one for street and one for tank pressure service—are of heavy copper, with riveted heads. Each is connected with two water-backs, so arranged that both boilers may be heated from either of two fire-boxes, or either boiler alone heated from either fire-box. The upper boiler is supplied from the street pressure and furnishes hot water for all the baths, basins and sinks below the third floor. The lower boiler is supplied from the tank and furnishes hot water for fixtures above the third floor. Those on that floor may be supplied from either, as explained in the first article—on the water supply. The supply pipe to the street pressure boiler is connected with that to the tank boiler by a pipe having in it a valve opening toward the latter, so that if the tank supply should fail, the tank boiler will fill from the street pressure ; or, by a stop cock on this connecting pipe, the tank boiler may be shut off entirely and the street supply only used. Vacuum pipes are connected with the hot supplies from each boiler to prevent any danger of collapse in case the supply fails. These join and enter the sediment pipe below the stop cock on it, thus furnishing an air inlet if there should ever be need of one. A valve on each pipe above their junction, opening inward, prevents the loss of water from either under normal conditions.

The following is an explanation of the lettering on the sketch : *a*, the street pressure boiler ; *b*, the tank pressure boiler, each about 150 gallons capacity ; *c*, the supply to the street pressure boiler, 1¼-inch, passing around through the outer divisions of three sink grease traps before entering the boiler ; *d* (1-inch) from the

FIGURE 2.

boiler *a* to a water-back in the right hand fire-box ; *e* (1¼-inch), return from the range to the boiler ; *f*, 1¼-inch, hot supply from the street pressure boiler, passing both to the upper floors and to the cellar ; *g* (¾-inch), return circulation to this boiler ; *h* (1-inch), the cold water connection from the same boiler with a water-back in the left hand fire-box ; and *i* (1¼-inch), the hot water return to the boiler. The (1¼-inch) pipe *k* is the supply to the tank boiler *b* ; *l* (1-inch) is the cold water connection of this boiler with the other water-back in the left hand fire-box ; *m* (1-¼-inch), the hot water return ; *n* (1¼-inch), the supply from the tank boiler going direct to the division cock on the third floor, and *o* (¾-inch), the return circulation. The other water-back in the right hand fire-box is connected with the same boiler by the pipes *p* (1-inch) and *q* (1-¼-inch). The vacuum pipes *r*, *r* (¾-inch), join and enter the sediment pipes below their junction. The latter are behind the range and not seen ; there is one for each boiler, being a ¾-inch branch from one of the two pipes leading from each boiler to the range. The combined sediment and vacuum pipe terminates over a sink in the cellar. The connection between the street and tank supplies, spoken of above, is marked *s*, and is 1-inch.

The remaining letters apply to the pipes under the enamelled iron sink at the left of the range : *t* is the entrance of the cold water pipe (supplying boiler *a*) to the outer part of the grease trap *u*, and *v* its exit ; *w*, *w*, is the waste (2-inch), forming a deep trap, and *x* the air pipe to prevent syphoning ; *y* is the hot water supply to the sink and *z* the cold, both ½-inch.

In a corner of the room, in front of the range, is a deep pot sink, of tinned and planished copper (not seen in the sketch) This has the same kind of grease trap on the waste. This sink is so deep and the bottom consequently so near the floor that there was not room to put the grease trap above it. Accordingly a hole was made large enough for it, through the brick and concrete floor and lined with an iron casing or box. The boiler supply water is passed around the grease trap in this way : the main line runs along beneath the floor (suspended from the ceiling of the cellar) past the location of the trap above. Directly opposite the trap a stop cock is placed on the main line and a branch, taken off on one side, passes through the trap and comes back into the main line on the other side of the stop cock when the latter is closed. If it is open and those on the branches closed i flows straight past. It may be well to explain here, for the benefit of those who have not seen this grease trap or a description of it, that the water is thus made to circulate around it (through an annular space entirely separated from the interior) for the purpose of cooling the collected grease and causing it to solidify. The supply to the boiler is chosen to effect this object because, not only is there no objection to thus slightly warming the water, but it is actually so much saving of heat.

Figure 2 shows the wall back of the pot sink and how the cocks are set out from it by a nickel plated frame ; also the air pipes or cushions for relieving the strain on the pipes when the cocks are suddenly closed. All the pipes with their frames, supports, and fasteners are nickel plated. The brass pipes are frequently bent in long curves, like lead, and sharp turns with elbows avoided as much as possible. The piping is all put together with frequent unions, so that it can be easily taken apart. It was all fitted in position while unplated, then taken down and put back after being plated.

Over the range is a very large copper hood for arresting and removing the odors and hot air. As this would have hidden much of the piping if shown in the sketch, it is only indicated in dotted lines. The outline is not strictly correct; the width is considerably greater, projecting in front of the range a foot or two. It is hung from the iron floor beams overhead. The hot air and odors from cooking are carried off through an opening in one end of the hood into a rectangular duct surrounding the smoke pipe.

A plate warmer on the back of the range was left out entirely to avoid confusion in the sketch. Attached to that are several gas burners to light the range. The gas pipe comes up through the range into one of the rods supporting the shelves of the plate warmer, and thence along behind the turned-down front edge of the upper shelf, and is thus entirely hidden.

BOSTON PLUMBING LAW.

The Committee of Plumbers, appointed at a recent meeting of the sub-committee of the Boston Common Council on the subject, called a conference of the Master Plumbers of the city for Friday evening, at the City Hall, and nearly twenty responded. Mr. James Tucker was chosen chairman and Mr. William Mills secretary. The secretary read the ordinance which had been drawn up by the Committee of Plumbers to present to the Council, and those present were invited to make suggestions regarding the ordinance and the rules to be adopted under it. The proposed ordinance provides that all master plumbers doing business in the city be required to register their names, places of business, and residence in the office of the Inspector of Buildings. Licenses shall be issued to competent persons after an examination, the fee being $1.co. New work to be done must be defined, and the specifications filed with the Inspector of Buildings and Master Plumbers are to file monthly returns at his office. The plumbers shall report on all water waste. The ordinance was favorably received. After some discussion, Messrs. Isaac Riley, William Trainer, William Mills, Matthew Walsh, Daniel G. Finnerty, M. H. Hartnett, G. C. Loring, James Tucker, Daniel Buckley, and William Locke were appointed a committee to draw up a set of regulations to be presented to the city government.

LETTERS TO A YOUNG ARCHITECT

ON

VENTILATION AND HEATING.

BY JOHN S. BILLINGS, SURGEON, U.S.A.

No. XLI.

The usual requirement of those schools in this country for which the architect will be called in to prepare plans will be that they shall contain from eight to twelve class-rooms, each of which is to accommodate from forty to sixty pupils, and that these are to be arranged in connection with a large central hall in a two-story brick building.

In some cases there will also be required one large assembly room, which is usually placed in a third story. The heating will be effected by furnaces or steam—the tendency being to increased use of the latter. The trouble with furnaces is that they are almost invariably set in insufficient number, and are of too small a size.

To undertake to heat such a school house as that above described with one or two furnaces is to ensure bad ventilation. Not less than four furnaces are necessary in such a building, and these must be of the largest size, giving a large heating surface, costing from four to six hundred dollars each when properly set.

A properly arranged and well-constructed steam heating apparatus for such a building will cost from four to six thousand dollars, depending on the exposure, etc. Cheap steam heating is more objectionable than a furnace. As a rule, school rooms are over heated, the temperature in winter in our schools ranging usually from 72° to 76°. The rule should be that the temperature should never exceed 70°, and Dr. Lincoln is no doubt correct in his statement that children can be made comfortable at 66° in a well-aired room.

The sensations of the teacher rather than those of the scholars usually govern the regulation of the temperature; and, as Dr. Lincon remarks, "an interesting lesson may be going on, or a written examination; the mind works well, for a time, at a fever heat, and the temperature of 84° may pass unnoticed. It is needless to say that such a strain upon the system is followed by a period of lassitude; and a state of lassitude, again, may demand a slightly raised temperature. Thus, by degrees, habits of preference for hot rooms may be found. The teacher may be as unconscious of the evil as the scholar; indeed, if fatigued, she may require, or if excited, may not notice an unusual heat. The time to correct bad habits in this respect is the beginning of the school year. Everyone then comes to school with a system invigorated by some months of exposure to fresh air: and, if care is taken, this vigor or power of resisting cold may be retained." To this I would add, that a slight modification of the alarm thermometer, which arouses the keeper of a green house by the ringing of a bell, when the temperature falls below a certain point, can be easily applied to secure the constant ringing of an alarm whenever the temperature rises above 70°, and that such an instrument would be a very useful reminder, and not very costly.

The arangements for ventilation of school houses by architects relate, as a rule, mainly to the removal of foul air—no sufficient attention being given to amount and location of fresh air supply. A common method of construction of late years is to provide an eight or twelve-room school building with two or four aspirating shafts or chimneys, connecting with the various rooms, and having an aggregate capacity sufficient, with a velocity in these shafts of about 8 feet per second, to remove from 15 to 30 cubic feet of air per head per minute. The air supply in these same buildings is to come from a few nine-inch flues, or, as in the Washington school buildings, through narrow slits placed beneath the window-sills. The plan in the Washington buildings is so very bad—and yet was so highly approved by the architect having charge of them—that it seems worth a little more detailed description. The fresh air is admitted through a perforated iron plate, set in the walls beneath the sills of the four windows in each room. The sum of the area of clear opening in the external plate of each window is from 22 to 25 square inches, making a total opening for the supply of pure air for the room from 88 to 100 square inches, or about two-thirds of one square foot, which would not give five cubic feet per minute per pupil. Having passed through the perforated plate above referred to, the air is supposed to pass downwards through a narrow slit in the wall, until it reaches the level of the floor, when it turns inwards, and then passes up through a steam radiator set against the window breast. Very little air comes through such an arrangement in comparison with what is required, but even this little is carefully shut out in cold weather to prevent draughts and the freezing of the pipes.

This method of heating a school room by steam pipes placed in the room should never be employed, for it is sure to involve a defective air supply, yet it is one that is peculiarly attractive to those who are not qualified to judge of the relative merits of various methods of heating, since it is comparatively cheap, and does give the requisite amount of warmth.

The practical effect of such a system when connected with a large aspirating shaft is that a large part of the air supply in the class rooms comes from the central hall as will be seen by testing the direction of the currents at the doors and transoms. This central hall, in turn, derives a large part of its air supply from the basement by means of the stairways. This basement air is liable to be rendered impure by the furnace and by the water closets, if they are placed in it, which should never be the case.

First of all then in planning a school house consider the air supply. With regard to the location and direction of the openings in the school rooms for the admission of fresh air, they should either be situated above the heads of the occupants or be so placed as to give an upward current; for the amount of floor space which can be afforded to each pupil is so small that some of them must be placed in unpleasant proximity to registers located near the floor in the ordinary way. The usual location, and one which gives good results, if the fresh air flues and registers are large enough, is to place them on the outer walls, in which case the window sills are a convenient place for the registers. Mr. W. R. Briggs, of Bridgeport, Conn., proposes to introduce the fresh air on the inner wall at a point about two thirds of the distance from the floor to the ceiling, and has constructed the Bridgeport High School upon this principle.

His description of the plan will be found on page 4, of Vol. V. of THE SANITARY ENGINEER. In a letter from Mr. Briggs dated Nov. 13, 1882, he informs me that the building has now been occupied for several weeks, and that the working of the heating and ventilating apparatus has been very satisfactory. There has not yet been any weather cold enough to give the apparatus a thorough test, but on some of the coldest days (in which ice was formed) the temperature on the outer and exposed sides of the room was found to be from one to two degrees higher than on the walls directly beneath the incoming flues. Should it be found that this plan gives satisfactory results, not only as to temperature, but also as to amount and distribution of air supply throughout the building during the prevalence of cold strong winds, a decided step towards simplification and economy in school building will have been made. The motive power for ventilation of ordinary medium sized school buildings can be best secured by an aspirating shaft or chimney, and as a rule two of these, one on either side of the central hall, are to be preferred. The size of these shafts will be determined by the fact that the velocity in them should be from six to eight feet per second. Knowing the total amount of air to be moved per second the calculation is very simple. If it be decided to use but one large aspirating shaft for the whole building, the best results will be obtained by carrying all the foul air flues downward and having them open at the bottom of the shaft. The reasons for this are given in my letter XXXI. (SANITARY ENGINEER, June 15, 1882, page 329).

Whatever be the system of ventilation adopted it should be supplemented by systematic and thorough aeration of the building by open windows in the intervals of the sessions. No doubt this will chill the rooms in cold weather, and increase the expenditure of fuel, but this is a necessary and legitimate expense.

[TO BE CONTINUED.]

A SIOUX BILL OF FARE.

One of the peculiarities of the latest United States style of feeding the noble red man is the fact that he is given Government rations, and at the same time appropriations are made which are supposed to maintain him.

Sometimes a wild Indian who don't know much about groceries and how to prepare them for food, comes in and draws his regular soldier rations in this way. For instance, up in the Sitting Bull country a while ago an Indian came in from the warpath who had never seen any of the pale-face style of food, and drew his rations.

He made a light meal of unground coffee the first day, and as he overate, and the coffee swelled on him, he had difficulty in buttoning his pants around the pain that he had on hand.

He felt very unhappy for a day or two, but laid it to the fact that he hadn't exercised much, and the consequent *ennui* and indigestion resulting therefrom.

As soon as he succeeded in getting his interior department quieted down a little, he tackled his ration of candles. These he decided to parboil, in order to avoid trouble from indigestion. The dish was not so much of a glittering success as he had anticipated, and as he remorsefully picked the candle wicking out of his teeth with a tent pin he made some remark that grated harshly on the æsthetic ears of those who stood near.

He then tried a meal of yeast powder with vinegar. He ate the yeast powder and then took a pint of extremely potent vinegar to wash it down.

At first there was a feeling of glad surprise in his stomach, which rapidly gave place to unavailing remorse.

A can of yeast powder in an Indian's midst don't seem to be prepared for a pint of vinegar, and the result of such an unfortunate circumstance is not gratifying.

Every little while a look of pain would come over the features of the noble child of the forest, and then he would jump about seventeen feet and try to kick a cloud out of the sky. Then he would sit down and think over his past life.

It took about a week for him to get back to where he dared to get up another meal for himself. Then he fricasseed a couple of pounds of laundry soap and ate that.

Soap is all right for external purposes or for treating a pair of soiled socks, but it does not assimilate with the gastric juice readily, and those who have tried laundry soap as a relish do not seem to think that it will ever arrive at any degree of prominence as an article of diet.

That is why this untutored child of nature swore. He had never received the benefits of early training in profanity, and his language, therefore, was disconnected and rambling; but when we consider that he was ignorant of our language, and that every little while he had to stop and hold on to his digester with both hands and dig great holes in the earth with his toes, the remarks didn't seem altogether out of place or irrelevant.

When a gallon or so of agitated baking powder and vinegar is singing its little song in the innermost recesses of an Indian, and this has been followed by a treatment of laundry soap, the student of human nature can find a wide field for observation in that locality.

The earnest and occupied look, the troubled expression of the countenance, followed by the quick nervous twitching of the muscles of the face, and then the swelling up and the bursting of the suspender button, the deep-drawn sigh and the smothered cuss-word, all betoken the gastric agitation going on within.

This is why an Indian prefers a link of bologna sausage and a two-year-old dog to the high-priced groceries so common to our modern civilization.—BILL NYE, in the *Laramie Boomerang*.

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.
Dec. 2, 1882	22.68	18.16	21.29	25.30	28.72	19.32

E. G. LOVE, Ph.D., *Gas Examiner.*

GAS AND THE ELECTRIC LIGHT.

The history of the past twelve months shows little change in the relative standing of the gas and the electric light companies in this city. Each industry can fairly claim to have held its own, and in certain directions to have made some progress. The constantly increasing value of gas stocks must have proved to any doubtful ones that the gas industry is not doomed to immediate extinction; and the fact that electric light companies continue to exist and even to multiply shows that, however small the present profits may be, there are a great many persons who are satisfied to place their money here, presumably in the hope of a rich reward hereafter. The recent action of the Edison Company in commencing the lighting of the down-town district is certainly encouraging—to the public, because it can now see and try this much-talked-of incandescent lamp; and to the holders of stock because there appears to be some immediate prospect of finding out just what return their investments will give. At the same time, the incandescent systems have yet to establish their claim to lighting on an equal footing with gas. That in certain places and under special circumstances the incandescent lamp will be found most useful, there can be no question; but it is from the general use of these lamps that success must come. It is now recognized that, if electricity is to replace gas for domestic lighting, it will be in the form of the incandescent lamp, and yet there are great possibilities in the future development of gas lighting which may reasonably be supposed to make the lamp but a poor competitor.

The arc systems of electric lighting never have, and probably never will, seriously interfere with the gas industry. So far as the public lighting of this city is concerned, the gas companies are not specially anxious to continue it, and naturally enough from their standpoint, for each 1,000 cubic feet of gas sold to the city for this purpose brings in about $1, while the same amount sold to a private consumer brings in $2.25.

The increasing number of arc lights in this city shows prosperity, and it is claimed that at present rates the companies are making some profit. We have no doubt, however, that the extent of these profits has discouraged many an investor who bought electric light stocks in the early days of the "excitement."

To the man who is called upon to pay a monthly gas-bill in New York, it must often be a matter of regret that the electric light in some form has not proved a more formidable competitor. Had such been the case we might naturally look for some reduction in the price of gas.

When the present Municipal Company commenced operations and promised gas at $1.50 per thousand feet, the unsuspecting public very naturally supposed that the time for cheap gas had come. This delusion was soon dispelled, for the inevitable "consolidation" came, and with it gas was found to be worth $2.25—at least this is what the public were asked to pay for it. Whether the electric light or some other cause is likely ever to effect a permanent reduction in price remains to be seen. At all events, it seems reasonably certain that the gas companies of their own free will never will make any reduction. The organization of new companies never gives permanent relief, but quite the contrary.

We certainly have no desire to rob the companies of what they might themselves consider a fair profit; but the profit at present prices is out of all proportion to the value of the commodity. It may reasonably be supposed that the public lamps in this city would not be lighted at a loss to the companies, and from their own estimate the gas is furnished at about $1.00 per thousand feet. To sell it then to private consumers at $1.50 would still give a handsome profit, even on the present enormous capital invested, and at the same time satisfy, or at least pacify the public.

It seems probable that New Yorkers are to be treated to another "new company" farce, as the daily press announce that a new company—the Equitable—has been formed under the leadership of the same gentleman who once before proposed to free the oppressed gas consumers of New York from the thraldom of "monopoly." Unfortunately, the Board of Aldermen some years ago were induced to pass an ordinance granting to any gas company which might be formed the right to tear up the streets of the city and lay gas mains—subject, however, to certain conditions to be named by the Gas Commission in each particular case.

When we remember the advent of the Municipal Company, and the statements made in its behalf by the promoter of this new enterprise, who, by the way, was the principal spokesman before the Gas Commission the other day, the conviction is forced upon us that it would have been in better taste if this enterprising individual had refrained from expressing solicitude for the gas consumers of this city and frankly stated that he was interested in a patent for an alleged new process, and that in order to be able to realize on it, it was deemed important that this new corporation should be allowed to tear up our streets once more, and it was also very desirable that more opportunities for the utilization of crude petroleum and naphtha should be afforded in order that those who have these products to sell may have a larger market.

This Equitable Company proposes to employ a new process, the success of which is by no means clear, and it asks the commission to state the conditions under which it may be allowed to experiment upon New Yorkers.

In return the company proposes to furnish gas to private consumers at $2 per thousand feet. It is quite needless to say that this reduction of twenty-five cents over present prices is no equivalent for the annoyance to which the public would be subjected by the company's operations. Granting that the enterprise is genuine, and that the company intend to construct works, and there comes in what is almost a certainty, that in the course of human events the new company will "consolidate" with the older ones, when after a period of lower prices, New Yorkers will have to pay exorbitant rates in order that dividends may be earned on the utterly excessive amount of capital invested in the gas business.

Meter-ites.

Coal gas escaping from the opened door of a stove killed two men at Harrisburgh, the 27th inst.

The Spring Garden Gas Works of Philadelphia, which have been long idle, were started up the 23rd inst.

A process has been patented in Germany for making explosive compounds by treating tar with nitric acid, and adding some oxidizing agent, as chlorate of potash.

Five or six miles of the eastern portion of the pipe line from the Bradford oil regions to the Delaware River at Philadelphia have now been laid. The Philadelphia *Bulletin* says that the whole line will be finished by spring.

The Metropolitan Gas Company of Chicago will erect new works at Hyde Park costing about $250,000. A franchise was granted them by the Trustees of Hyde Park in 1881, and they propose to furnish gas for both heating and lighting purposes.

A draft of plans for the new works of the Consumers' Gas Company of Chicago, has been submitted to the Commissioner. Six buildings, estimated to cost $100,000, will be erected by next summer. The plans are a duplicate of those of the Equitable Gas Works of Baltimore; W. H. White is the engineer.

A report was adopted in the special Committee of Councils of Philadelphia Dec. 1, providing for the sale of the gas works. The Treasurer must furnish gas for not more than $1.50 per 1,000 feet, the city to be allowed a discount of 10 per cent. on gas supplied to public lamps. No bid less than $10,000,000 will be considered.

Utica has entered into a contract with the Oneida Street Lights Company of that city, to light certain lamps at a cost of $23.75 per lamp per year, if the contract run for three years, or for $23 per year if run for five years; the lamps to be lighted 27 nights in each month, to burn on an average ten hours per night.

The City Attorney of Rochester has expressed the opinion to the Mayor that the city has the right to substitute gas lamps by electric lamps, in view of a provision in the contract with the gas companies, reserving the right to substitute electric light in the place of any gas lamp, and the city would not be liable to the gas companies.

A gas explosion occurred in a business house in Rochester the 26th ult., caused by the gas escaping from a broken fixture. The gas had been escaping from the fixture which was in the basement, unnoticed for a considerable time. When afterward an attempt was made to light gas at this fixture an explosion occurred, which threw cases of goods about, but did not seriously damage the building.

A passenger car of the New York, Lake Erie and Western Railroad recently arrived in Chicago burning the Pintsch system of lighting. The Chief Engineer of the Pintsch Company, who was in charge of the car, told a reporter of the Chicago *Times* that the gas cost in Jersey City $1.55 to $1.75 per 1,000 feet. The cost of the burners and tanks is $265 to $300 per car. The light was produced at the rate of 1¾ cents per hour.

Mr. C. W. Siemens, in his opening address at a recent meeting of the Society of Arts, reviewed several interesting questions relative to illumination by gas and electricity. Among other things he said: "I do not, however, agree with those who expect that gas lighting will be entirely suspended, but have on the contrary, always maintained that the electric light, which possessing great and peculiar advantages for lighting our principal rooms, halls, warehouses, etc., owing to its brilliancy, and more particularly to its non-interference with the healthful condition of the atmosphere, will leave ample room for the development of the former, which is susceptible of great improvement, and is likely to hold its own for the ordinary lighting up of our streets and dwellings."

ELECTRIC LIGHT NOTES.

The directors of the Mercantile Library of Philadelphia have had electric lights placed in the newspaper rooms.

The Canterbury Cathedral is to be illuminated for three months by lamps supplied by the South-Eastern Brush Electric Lighting Company.

The winter electric exhibition at the Westminster Aquarium, will open about Christmas. It is stated that the prospects are now good for success.

Engineering states that most of the factories at Gand are now lighted with electric lamps. The spinning mills of La Lys, where several thousand workmen are employed, are to be so lighted throughout.

The London *Times* states that Mr. Jablochkoff has invented a new electrical machine, which can be used either for converting motive power into electricity or as an electro-dynamic machine converting electricity into motive power.

A conduit for electric wires, recently patented in this country and England, is made of pottery clay, the sections laid end to end, and secured by Portland cement. Each section consists of an upper and lower half, the latter having compartments for the wires. Elbow lids are introduced at intervals for capping the wires.

The art department of the Industrial Exhibition at Charleston, S. C., was illuminated by 42 incandescent lamps hung about the four sides of the space devoted to the art exhibits, and 12 lamps attached to a chandelier in the centre. The lights attracted much attention, and were considered one of the most interesting features of the exhibition.

Hartford, Conn., having asked several electric light companies to submit estimates of the cost of street lighting, has received several replies. The Excelsior Electric Light Company of this city, thought it could furnish light at 80 cents per lamp per night. Several other companies asked for more definite information before making estimates, and no replies were received from the Edison and Brush Companies. The Hartford Company were not prepared to make any estimate. The Street Board will have a hearing on the matter at an early day.

AN EXPLANATION.

THE DURHAM HOUSE DRAINAGE COMPANY,
No. 187 BROADWAY, NEW YORK, *Dec.* 5, 1882.

To the Editor of THE SANITARY ENGINEER:

DEAR SIR:—In reference to a criticism passed upon one of the illustrations in the pamphlet published by the Company, in your issue of Nov. 30, I beg to state that your assumption that it was a draughtsman's error is correct. We are glad to have our attention called to the matter, and will have the block corrected.

Very truly yours, C. W. DURHAM, *President.*

SANITARY OPINIONS FROM PODUNK.

The following letter published in the Philadelphia *Medical Times* of July 5, 1873, is good enough to reproduce here. If the writer is still in existence THE SANITARY ENGINEER would be glad to hear from him.

Dear Tim :—

You will be glad to hear that I am now Health Officer and President of the Board of Health of this metropolis; and I find that your advice to go in for hygiene as a promising lead was sound, as it generally is. I made my first move in the department of ventilation—got up a new system by putting the openings at the middle, instead of top or bottom; and my new American Universal Ventilator is a success—can be applied to anything, from a hat to a hospital, and is now being introduced by order of the Board of Health into every chimney and hack in town. I get three dollars royalty on each one; how high is that? I am now getting up a hygienic cooking stove with disinfecting attachment, and I don't think there is less than five thousand dollars in it. But to come to the point I am going to start a daily hygienic journal, *The Podunk Sanitorial Cosmopolitonian*, to be printed on medicated paper and of suitable size. I want you to write some articles for it, urging from the legal point of view, the necessity for legislation on the subject, and for a Central Bureau of Hygiene; and I want you to write, or get some one to write, an article on the climate of this part of the country as good for cancer and baldness.

The climate changes pretty often and pretty fast—is hot and foggy and damp and raw, and couldn't be recommended for consumption no way. But there are no cases of cancer here, for the last one died about two weeks ago; and the druggist told me he had three pounds of cundurango left, and no customers; and did I think it might be good for anything else—such as granular lids, or biles, for instance? Well—don't you see? The climate here must be good for cancers, and you can say as much as you like as to its effect on the baldness. What I propose to do for the science of hygiene is to make it practical, you know,—bring it before the public in such a way that none will know it but to love it, so to speak. The demand of the age is for statistics, and I am going to have some. Take corns for instance. The average is 1,3007 to each individual. But what a corn doctor wants to know, and what the spirit of the age demands, is precise data as to the influence of locality, climate, diet, and ventilation upon their growth and development. And the *Cosmopolitonian* will have those data, for I am going to make them.

I shall advocate Congressional legislation of course; and that's where I want your assistance. What I favor is a corps of United States sanitary inspectors—say one for each State and territory, and a dozen for Europe and Asia. Have a handsome series of blanks prepared, including all possible questions, and let the inspectors report once a month. I suppose there would have to be some sort of a head centre for them to report to; though there are some objections to it. Depend upon it, that is the system that is going to be established, and you can't do better than put yourself in training for one of the inspectorships by writing some sanitary articles for me. Of course, we must organize and keep out the quacks, who are intruding everywhere; there's one on the Board of Health here, who got the place on the strength of a sanitary tooth brush with a hollow handle to be filled with hygienic powder, which passes out between the bristles, on the principle of Mason's potato drill. I'd like to put one of my ventilators into the side of his head.

By the way, I could get the office of chemist to the board created, and hold it myself, if you can find me a good, competent man for assistant, who will run the department and not blow about it.

To return to the organizing. The National Health Association have got the start of us, but they have taken in a number of people who don't care about office—in fact, who have got good places now, and therefore will criticise and object to all moves which will be of any "practical use" to the organizers. If I hadn't thrown away time and opportunities I might now perhaps, be in Washington in a comfortable office as chief of the National American Republican Sanitary and Hygienic Enforcement and Vitally Statistical Bureau, and if I was, I can tell you that the N. A. R. S. H. E. V. S. Bureau would be an institution worth caring for. But the bloom has been brushed from that *idea*, and we will go in on a bigger platform.

Yours as usual, D. D. DOUCEIT.

Correspondence.

MALARIA AND ONIONS.

NEW YORK, *Nov.* 13, 1882.

To the Editor of THE SANITARY ENGINEER:

I concur with you in your objections to Dr. F. H. Hamilton's article on "Sewer Gas" in the *Popular Science Monthly*.

If his views on sewer gas were accepted in their full length and breadth they would be so alarming that we might expect to see 50 per cent. of the population of New York city die every year from that cause alone.

But, fortunately nature has provided a safety valve—in short, it is proved by my experience and that of many others that persons can live with impunity though surrounded by an air full of malaria, sewer gas, vile smells of all sorts, etc., and yet grow fat and hearty, provided they will partake of certain articles of diet of an antiseptic nature, the chief of which are garlic and onions. Another is lemon juice, a third is seltzer water or bicarbonate of soda in water; and there may be many others. The garlic and onions acting through the salicylic acid that they contain.

Look at the Jews in London. They live in the dirtiest quarter of that city, yet they laugh and grow fat with their diet, of which onions form a large share.

Look at the Italians of New York city, who live on a piece of bread and garlic and get stout and strong on them, outworking the native Americans.

Remember the New Jersey farmers, who two years ago, cured their horses and themselves of the great epizoötic with common New Jersey wild onion. See Rufus Hatch, the great Wall street banker, who in the newspapers has recommended everybody to use Bermuda onions, saying their constant use would bankrupt the undertakers and close up half the doctors' offices.

What is the explanation of this? Simply this: The mode of operation of malaria, sewer gas, and bad smells generally, is to cause a weakness of the kidneys in a person thus affected; they do not carry off all the uric acid produced in the blood every 24 hours. There is constantly an accumulation of this dangerous uric acid in the blood, the first effect of which is neuralgia or rheumatism; the next and more terrible effect, is fermentation of the blood, which thereby becomes coagulated and septic. This in its turn produces diphtheria, pneumonia, typhoid fever, smallpox and other zymotic diseases.

Rid the blood of this surplus of uric acid and you cure these diseases. Garlic and onions will do this, particularly if assisted by bicarbonate of soda and lemon juice, and a cathartic like aloes or castor oil to carry off that part of the blood which has already become foul or rotten, in the shape of mucous matter discharged through the bowels.

This being established and proved, by my own personal experience, and easy to test by any person, it follows that if a person will daily partake of garlic or onions they will have a perfect immunity from the effects of sewer gas, malaria, etc., and can very safely defy them, a fact that Dr. Hamilton should have known long ago. But here comes in this most unfortunate prejudice that our American people have against these healthy articles of diet, and this it is that is making us a nation of weak, nervous people. Our climate is much more malarious than that of Europe. Every time that that former big swamp, our Western prairies, is ploughed in spring and fall, the air becomes overloaded with malaria, which the prevailing west winds waft here and which we breathe, and yet we neglect our only means that are universally and cheaply applicable to counteract this morbid condition of the air, viz.: a diet containing garlic and onions. But we pay dearly for it in the torments of neuralgia, which causes so much suffering every fall to our ladies, and in the increase of insanity, in the various zymotic diseases, and the deaths they cause, in the immense consumption of whiskey and other stimulants and in drunkenness. A healthy person using garlic and onions will not feel the need of liquor to stimulate him. The garlic and onions will stimulate him just as much as whiskey without its bad effects. This is probably a new theory to you, Mr. Editor, but all I ask you is to go ahead and prove it by your own experience, and then to go ahead and do all the good you can in God's name by helping others through it. Yours respectfully,

A CHRISTIAN.

P. S.—Ask any horse jockey what he means by the expression "to garlic a horse," and what the effect of garlic is on a horse in making him look young again.

[Such a simple universal panacea as our correspondent proposes has long been sought for, and a number of people believe that they have found it. The majority of these people at present are cared for in institutions specially provided by the State for that purpose, and are happy in their faith, which we have no desire to disturb.

During the middle ages the onion was considered to be a preservative against the plague, and was known as the "Theriac of the poor." Applied to the stomach of infants it was supposed to kill worms. Diphtheria, pneumonia and typhoid flourish where there are no sewers and no malaria. And our friends in Arizona and New Mexico, who are familiar with the sight (and smell) of a Mexican, reeking with onion and garlic, and shivering with ague at the same time, will have their doubts as to the theory above propounded.]

ATTEMPT TO SCAMP.

NEW YORK, *Nov.* 14, 1882.

To the Editor of THE SANITARY ENGINEER:

Where a contract calls for extra heavy iron soil pipe, is the plumber justified in supplying *selected* pipe of ordinary weight? This was done in a certain case by a reputable plumber. ARCHITECT.

[Not by any means. We should consider it an attempt to scamp. We have repeatedly suggested that architects should specify the weight per foot of pipe which is given in the catalogues of reputable manufacturers, who, by the way, should cast the average weight on each length.]

THE SYPHONAGE OF TRAPS.

SAN FRANCISCO, CAL., *Nov.* 15, 1882.

To the Editor of THE SANITARY ENGINEER:

It is with sorrow that, in the interest of right, I must differ with such an authority on sanitary matters as Col. George E. Waring, Jr., who, in his published report on the Syphonage of Traps, has again proved an old saying amongst us Californians, viz., that "no one man knows it all." While we are willing to admit his ability as an engineer in large works, I think the matter in question was a subject with which he did not have any previous experience, and therefore in justice his deductions should only be entitled to the same consideration that would be shown to the amateur sanitary engineer who should attempt to upset and declare unnecessary all the rules laid down as requisite by the best drainage engineers of the world. As a plumber with a quarter of a century's experience, I hold that the experimenting apparatus used was not a fair sample of the plumbing work as found in an ordinary dwelling, and therefore the deductions made should not be given to the public as such. If the report was headed, "How to Build Safe Plumbing with Only One Vent Pipe" (and make your house conform to it), and ended with the original proviso that, under no circumstances should the branch waste pipes from bath or basins be longer than seven feet from the soil pipe, the public would not be deceived; but the fact that the report has been published in the *American Architect* makes me fear that the patrons of that journal all over the country will be inclined to cease all study in the matter of preparing specifications for plumbing work, and fall back again into the old method of having it done as cheap as possible, without regard as to its safety, from a sanitary point of view.

My objections to the report are:

First—The experiments only covered the work on one story. Had the experiments included the work of two or more stories, the results would have shown a different state of affairs, and even with the soil pipe open on top, all the traps on the lower floor would be found to have lost their seal.

Second—The glass traps used in the experiments contained a water seal of from 3 to 5 inches, while the traps in actual use have only a seal of from 1¼ to 1½ inches, and the liability to syphonage in the trap with the light seal is far greater than in such a trap as used by Colonel Waring.

Third—I believe that Mr. Waring himself has said as many hard things about the common pan closet as anybody, and I am surprised that he should have chosen it to use in the experiments. Had the tests been made with any of our modern water retaining closets, even though they only extended over the work of a single story, I think the report would never have been published, and I hold that the receiver of a pan closet and the air space in that portion of the trap from the floor to the water line, as shown at Fig. 4, was a far different thing for the water from the bowl to fall into, than in the case with the water from the bowl of one of our modern closets, for in the case of the closet tested, the water could only fill one-fourth of the space, while in the case of the modern closet the whole space would be filled, and the difference is as between a pipe partially filled and one filled solid.

Hoping that those who are better able to show the fallacy of such a report will not miss the occasion, I remain

Yours respectfully, JOHN J. DIXON.

[In the *American Architect* of November 25, Col. Waring, in alluding to his experiments, states, "in one sense they are of little value, for the experiments of others show that under other conditions the open top of the soil pipe may fail to protect the trap."]

FOOT VENTILATION.

To the Editor of THE SANITARY ENGINEER:

The sketch I enclose is of an English villa with soil pipes outside the house. Is there any objection to placing a ventilating chamber and grate where shown? There is at present no means of ventilation between the soil pipe and the sewer. Should the ventilating grate be between

Digitized by Google

the servants closet and the sewer? If so, will that be sufficient to create a current of fresh air through the soil pipe? Generally, is the ventilating chamber trapped on the sewer

side, to be avoided when within a few feet of a door or window and be placed at a greater distance from the bottom of the soil pipe? By answering these questions you will oblige, R. H. T.

NEW YORK, *Nov.* 2, 1882.

[The fresh air inlet as shown in the sketch would provide only for the circulation of air through the vertical soil pipe. If the main trap was located beyond where the branch from the outhouse closet joins the house drain, and set in a vault with the fresh air inlet opening in this vault, with grating over it, you would remove the dead end that exists between outhouse closet and the main trap, located as shown in your sketch; otherwise we see no objection to locating fresh air inlet as you propose.]

RADIATORS WITH ONE VALVE.

To the Editor of THE SANITARY ENGINEER:

In your editorial note, page 367, referring to my diagram of heating apparatus, you are entirely wrong. Steam can be regulated as easily as gas or a stream of water by partially closing the valve as much as needed. I hope you will see this and will rectify it for your readers' benefit. I am yours faithfully, F. BOTTING.

[The editorial note mentioned appeared at the bottom of page 367, sixth volume, and is a comment on a letter of Mr. Botting's (same page) which refers to the "Thermus" article of July 20. The article goes to show there is *one* condition with a gravity system of piping under which the *temperature of the surface of the radiator may be lessened by reducing the pressure and consequently quantity of the steam as it enters through the radiator valve* (the pressure in the boiler remaining unchanged), and at the same time allow the water which forms within the heater by condensation to run out of the radiator at the opposite end (or through another pipe connected any place to the base and sufficiently low down) and not choke it with water.

Mr. Botting's letter began by quoting from the "Thermus" article, saying, "The fewer the parts there are to a steam apparatus, and the simpler they are, the better," and then it goes on to describe and illustrate the *one pipe system* (see Fig, 1, page 2, Baldwin's "Steam Heating for Buildings"), so much in use in this country some 12 to 15 years ago for private houses, and sometimes known among steam fitters as the "Gold system," because the Gold sheet iron heaters were always connected this way.

At the time we inferred that Mr. Botting thought he was bringing to our notice a system new to us, but we refrained from saying more than simply pointing out the most serious objection to the *single pipe* and *single valve system*, namely, that if the valve leaks, or is carelessly closed, the heater will fill with water; and that the valve must be either open wide or closed tightly; no graduations being admissable. If steam is passed to an engine or pump, or for any purpose where the passing of the steam only is the object, it can be regulated to a certain extent by "*throttling*," but when all the steam which passes such a contracted vein, with a comparatively high pressure at one side, forcing its way in the direction of the reduced side, where it is to be condensed, *it cannot, after it has been formed into water, be made to pass back again through said contracted opening in a contrary direction to the jet of steam entering the heater.* The question is not the regulation of steam. It is the reduction of the temperature and quantity of steam admitted to a radiator, when that radiator has but one connection.]

HORIZONTAL CHECK VALVE.

To the Editor of THE SANITARY ENGINEER:

I enclose a drawing of a job of plumbing I did. The bath room is on the fourth floor, where the water don't rise at

all times. I put a tank on the floor above; it is supplied through a 5/8-inch pipe with two check valves. Will you be kind enough to inform me what prevents the water from rising through the pipe from the tank. The pipe is clear of all obstructions; I can blow through it easily.

Respectfully, JOHN NEWELL.

[The trouble seems to be in the horizontal check valve, which we infer is one of the spindle pattern, the spindle passing through a bridge or guide; they are not suitable in such a situation, as they are liable to stick to their seat. We suggest that you use the hinged valve, which is made Y-shaped, or possibly the old style leather clapper valve will be better. The former can be put on a horizontal pipe; the latter only on a vertical one.]

STEAM PIPES AND DISEASE GERMS.

MONTCLAIR, N. J., *Nov.* 18, 1882.

To the Editor of THE SANITARY ENGINEER:

What is to be the effect on the health of the city by the piping of our streets with steam pipes maintained at a high temperature by the steam power companies? If the organic matter, everywhere present, is to be nursed into life by the heat beneath it, the disease emanating from germ life might become a terrible menace with an incubator of such magnitude to favor its growth.

Respectfully, SAM'L CRUMP.

[The steam pipes are so insulated as to give out very little heat; were it otherwise the business would not pay. They are for the most part laid at such a depth that the amount of soil above them would be a sufficient filter for all germs developed in their immediate vicinity. Were they laid in ground filled with street sweepings, etc., there might be for a time some development of gases, but the supply of material would soon be exhausted. The question is a suggestive one, and observations made upon the soil in the vicinity of some of these pipes would be of interest.]

SANITARY READING.

HIGH SCHOOL, NEWARK, N. J., *Nov.* 16, 1882.

To the Editor of THE SANITARY ENGINEER:

Can you assist me, by referring to methods, or authorities, in the preparation of an article on "Hygiene of our public schools," for the Newark Teachers' Institute? I desire information on the analyzing of air, especially. Any help you can give through your columns, or otherwise, will be publicly acknowledged and duly appreciated by, Yours respectfully, G. C. S., *Instructor.*

Report on School buildings in the District of Columbia. Doc. 35. House of Representatives. 47th Congress, 1st session. Washington, 1882. Congrès International de l' Enseignement. Bruxelles, 1880, 8vo. (for papers by De Chaumont, Dekeyser, Wazon, Norjon and Javal).

Circular No. 2. Bureau of Education, Washington, D. C., 1882, contains papers by Drs. Billings and Smart, U. S. A., on Methods of Examining Ventilation of a School Building, and on Air Analysis.

In his introduction to "Eighteenth Century Essays" Mr. Dobson writes the following stanzas:

With slower pen men used to write,
Of old, when "letters" were "polite;"
In Anna's or in George's days,
They could afford to turn a phrase,
Or trim a straggling theme aright.

They knew not steam; electric light
Not yet had dazed their calmer sight;
They meted out both blame and praise
With slower pen.

More swiftly now the hours take flight;
What's read at morn is dead at night;
Scant space have we at art's delays,
Whose breathless thought so briefly stays
We may not work—and would we might—
With slower pen.

Food and Drugs.

INSTRUCTIONS TO STATE ANALYSTS.

The State Board of Health, Lunacy and Charity of Massachusetts have issued instructions for the government of the analysts charged with the examination of articles under the adulteration law which was recently passed in that State. After defining what constitutes adulteration in accord substantially with the law of this State, the regulations continue:

TO PROCURE SAMPLES.

Third.—The analysts shall procure in the manner provided by the Act or in any legal and proper manner and with reasonable diligence, drugs and articles of food included in the provisions of this act for the purpose of examination and analysis and shall report to the board the results thereof together with such suggestion as they may deem necessary to the efficient enforcement of the law.

Fourth.—They shall also report to the board from time to time such articles, mixtures or compounds as, in their judgment, should be declared exempt from the provisions of the act, and they shall present to the board lists of such articles or preparations for publication by the board if the latter deems proper.

Fifth.—Should the result obtained by either analyst be questioned, the other analyst shall repeat the analysis, unless otherwise instructed by the board, provided a sufficient sum to meet the expense of analysis be deposited with the health officer by any interested party feeling aggrieved, which sum will not be returned unless the second analysis fails to confirm the first in essential particulars.

Sixth.—Any appeal from the decision of an analyst shall be filed with the health officer, who shall report it, and any matter in controversy to the board, giving his judgment thereon, and the board shall supervise and control the action of its officers in executing this act.

STANDARDS OF QUALITY.

Seventh.—Where standards of strength, quality or purity are not fixed by the Act, the analysts shall present to the health officer such standard as in their judgment should be fixed, and the health officer shall report the same to the board for its action. The standards set by the British Society of Public Analysts will be followed as nearly as practicable until otherwise ordered.

Eighth.—Whenever a drug or preparation not described in a National Pharmacopœia or other standard works on *materia medica* shall be manufactured, offered for sale, or used in this State, the standard of such drug, and the standard and proportions of the ingredients of such preparation and the range of variability from such standard or standards shall be ascertained of the analysts, who shall report the same through the health officer to the board

Ninth.—Each analyst shall procure all necessary and proper samples of drugs or articles of food for analysis by tendering to the party manufacturing for sale, exposing for sale, offering on sale, or delivering on sale the value of a necessary and proper sample in each instance, and each analyst shall arrange his samples for analysis as he may deem convenient and expedient.

Tenth.—Lists of these articles, mixtures or compounds declared to be exempt shall be published and a copy sent to each Board of Health, each correspondent of the Health Department, and to such publications as may from time to time be determined.—*Com. Bulletin, Boston.*

SOLUTION FOR DETERMINING THE HARDNESS OF WATER.

The *Chemist and Druggist* mentions a new method of making a volumetric solution for determining the hardness of water, suggested by Mr. C. R. C. Tichborne, in a paper read at a meeting of the British Pharmaceutical Conference.

The writer proposes to prepare a definite oliate of soda in place of the soap solution now employed. Oleic acid forms both a monobasic and a dibasic salt. Either will answer for the purpose.

The following is the process:

Five c. c. of oleic acid are measured with a pipette and 50 c. c. spirit added to it in a beaker; two drops of phenolphthalein solution are also added, and immediately a volumetric solution of soda is run in until a pink indication is produced. This indicates that the point of neutrality has just been passed. The result is a solution of the monobasic salt. A drop more of the volumetric solution of soda develops the pink to a magenta, but, as the process goes on the solution again becomes decolorized, indicating the formation of the dibasic salt. When half the second equivalent of soda has been added the solution begins to pectise, and when the process is complete the solution becomes a solid jelly. Whichever solution is made (the author prefers the latter, as it lathers more freely and is more permanent), the oleate of soda is then made up to the required measure by the addition of a mixture of equal parts of rectified spirit and distilled water.

The advantages claimed are that the soap solution may be made in five minutes, requires no titration against a standard water, and is more permanent than those made from ordinary soaps.

WHAT IS PURE MILK?

The English Local Government Board is puzzled to know how to define "pure milk." At present it seems impossible to discrimate between the milk of a poorly-fed and poorly-kept cow, and that of the very best milk which has been adulterated with water. Chemical analysis simply shows the amount of water, fat, etc., but cannot tell whether the water has been added or whether the milk was naturally dilute.

It is but reasonable to demand that so important an article of diet as milk should not be offered for sale if it comes from an animal not properly cared for. This would dispose of cases which would naturally arise.

If any standard were adopted it would of necessity have to be based upon the relative proportions of the different constituents of milk supplied by a well-kept cow, and that no injustice might be done the poorest sample of milk so furnished would constitute the standard.

The average of a large number of samples would form the best standard, but in certain cases milk would be found below such a standard, and yet be furnished by a well-kept cow.

Fortunately, the milk supply of our large cities is composed of a mixture of the milk of a number of animals, and an average is thus more nearly obtained.

ARTIFICIAL QUININE.

A few months since the scientific world was surprised by the announcement that the French chemist, E. J. Maumené, had discovered an exceedingly simple synthesis of quinine, based on the use of a compound (NH_2) never yet produced. It was then stated that all that remained was to compare the therapeutic effects of the natural and the artificial alkaloids. It was considered strange that Maumené should be the man to discover the process, inasmuch as his previous investigations had been in other directions. It has also seemed strange that the patient and protracted labors of many German chemists, who have worked for years upon this problem, had resulted in nothing tangible. Maumené had, however, a reputation for good work in other directions, and, in consequence, his plea for more time was considered proper, and chemists waited patiently for the details of the process which was to make the cultivation of the cinchonas no longer a necessity. But, as time elapsed, doubts were expressed, and soon other chemists began to experiment. Maumené had described the production of NH_2 by the action of potassium permanganate upon ammonium oxalate, and had produced a carbonate of the new base.

M. Combes* has gone over the same ground, and proves that "the only products of the reaction are ammonia and carbolic acid." He changed the ammonia carbonate into chloride, and then obtained conclusive analytical evidence in support of his statements.

We understand that the whole question has been submitted to the eminent chemist, Wurtz, from whom an impartial and authoritative statement of facts may be expected.

At present it seems exceedingly improbable that Maumené's results and statements will be confirmed.

ADULTERATION OF SAFFRON.†

The blossoms of marigold (*calendula*), dyed red, have often been used for the adulteration of saffron, which sophistication admits of ready detection by throwing a small portion of the suspected drug into water, whereby the flowers unroll, and can be respectively recognized.

To avoid this easy detection, the fraudulent dealers now employ a mordant which renders the false color impervious to water; for Dr. C. Grote, apothecary in Brunswick, has met with *Flores calendulæ* colored in this way. By mixing some caustic ammonia with the water, however, the mordant gives way, and a small quantity of a mucilaginous mass is found at the bottom of the vessel in which the flowers have been tested. The flowers then expand as usual.

Dr. Grote states that the adulteration of saffron with marigold flowers, thus colored and mordanted, now frequently occurs, and as the whole is just slightly moistened with glycerine, so as to give it a bright appearance, the adulteration is not at first detected.

*Compt. rend. 94, 1,717.

† *Chemist and Druggist, from Pharm. Centralhalle, Aug.* 3, 1882.

INTERLEAVED COPIES.

If every working pharmacist will buy an interleaved copy of the Pharmacopœia, and record opposite each preparation, whatever practical points suggest themselves upon trial of the various processes and tests, it will not be long before the book will have acquired a double value. It is surprising how often these practical observations will come into use, and how many repetitions of mistakes once made may be avoided.

JAM FROM TURNIPS AND TAR.

According to the correspondent of a trade journal, it is a mistake to suppose that fruit is absolutely necessary to the manufacture of preserves. He describes a visit to a large jam-producing factory, in which he found that the work was being bravely carried on without the aid of fruit at all. Jams of various kinds were being produced before his eyes—currant, plum, strawberry, apricot, raspberry and gooseberry. Yet neither currant, plum, strawberry, apricot, raspberry nor gooseberry was in the building. Turnips served the purposes of the fruit. The flavoring matter was extracted from coal-tar and the resemblance to raspberry and strawberry jam was further produced by mixing the boiling compound with small seeds of some cheap innocuous herb. A common form of sugar is used, and this is the only honest ingredient of the mess. These preserves are offered as made from "this season's fruit."—*London Times.*

Wooden hams and nutmegs have not been unheard of as articles of trade, but wooden cloves seem to be a new invention. An East India paper publishes as a fact, that several bags of cloves received in London from Zanzibar were mixed with artificial cloves made from wood by machinery. The cloves were made of soft deal, stained a dark color and soaked in a solution of essence of cloves to scent them. —*Analyst, Nov.*, 1882, p. 208.

THE BOSTON CATTLE QUARANTINE. STATION.

Fifty thousand dollars was appropriated by the last Congress for the establishment of cattle quarantine stations at the ports of Baltimore, Philadelphia, New York, Boston and Portland. The site for that of Boston has lately been selected, and is described in a recent issue of the Boston *Transcript.* It is located in Waltham (twelve miles from the city) a mile from the centre of the town, between the Charles River and the Fitchburg railroad track. It comprises thirty-five acres with a chance of increasing the area if desired. A large yard will be enclosed and several sheds erected, 40 x 80 feet, giving accommodation for forty cattle each. Cattle from foreign ports will be brought here at once, on arrival, and retained ninety days to determine whether they have contagious diseases.

Unprecedented improvements have taken place in Vienna during the past twenty years. Nearly $40,000,000 have been spent on the city water works, school buildings, new town hall, main drainage, widening and paving of streets, and other useful and ornamental works, including the Danube embankment.

By an order adopted November 22, the Boston Board of Health forbade public funerals over the remains of persons who have died of small-pox, scarlet fever, diphtheria, or typhus fever, unless the written permission of the Board is first obtained. Bodies of such persons must be placed in tight coffins and may not be exposed to view.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

KOSMAK'S FIRE ESCAPE.

The apparatus described below is the invention of Mr. Gustav Kosmak, a member of Engine Company No. 6, of the Fire Department of this city. In brief, it consists of a

FIGURE 1.

basket or cradle, suspended by ropes or chains from a carriage running on a horizontal track under the cornice at the top of the front of a building, both so connected with

FIGURE 2.

suitable mechanism placed in an easily accessible position that the basket or cradle may be quickly moved to any spot on the face of the wall and persons rescued from any window.

The following explanation of the accompanying drawings makes plain the arrangement and working of the various parts.

Fig. 1 represents the front of a house with the apparatus in use as an escape, the front of the cornice being removed to show roughly the carriage and pulley arrangements behind it.

Fig. 2 shows the cradle occupied by firemen to carry hose to the upper windows. In both, the casing enclosing the chains connecting with the moving machinery at the ground is removed.

FIGURE 3.

Fig. 3 is a larger face view of the track and carriage beneath the cornice, and Fig. 4 a cross section of the same.

FIGURE 4.

The latter shows how the carriage *D* is supported on the rails *c*, *c*, and hidden and protected by the front of the cornice *B*. To each end of the carriage is attached a chain passing around the pulleys *a* and *b*, which, with the carriage, forms an endless chain, moved back and forth by another endless chain *F* over one of the pulleys *a* connecting with a windlass below. A third chain or rope *H* (the upper part of which is divided into two parts *e* and *f*—one over each of the pulleys *g* and *h* at the ends of the carriage *D*) passing over the pulley *d*, and supporting the basket or cradle, is attached

FIGURE 5.

FIGURE 6.

FIGURE 7.

to a second drum at the bottom, which is operated by the same windlass.

The remaining drawings show the machinery for moving the carriage and cradle. This may be placed as shown on the front of the building on a level with the sidewalk, below the sidewalk, or elsewhere, but the inventor prefers the position shown in Figures 1 and 2, where the firemen and policemen could have most direct access to it. It would be kept under lock and key to prevent its illegitimate use by burglars or others.

Fig. 5 is a front view of this machinery; Fig. 6 a side view and Fig. 7 a top view. The windlass shaft *M* (to which is attached the crank *n*) has on it two spur wheels *i* and *j*; the spur wheel *i* is always in gear with a toothed wheel attached to the drum *J* on which is wound the chain or rope *H* attached to the cradle, but the other wheel can be thrown in or out of gear (by the clutch-lever *m*) with a toothed wheel *l* fastened to the shaft to which is also fixed the pulley *G* carrying the endless chain *F* for moving the carriage and cradle horizontally. When the cradle or escape car is to be raised or lowered, the pinion *j* is thrown out of gear, but when it is desired to move the car horizontally *j* is thrown into gear, while *i* still remains in gear, so that both the drum *J* and the pulley *G* are revolved at the same time. The ratios of the diameters of the pinions to the diameters of the toothed wheels are so adjusted, however, that the effect of the rotation of the drum *j* is only to give or take up the slack of the rope *H* sufficiently to allow the horizontal motion without producing any vertical motion of the car. Attached to the drum *J* and the pulley *G* are ratchet wheels to receive pawls for holding the car in any position as long as desired. A foot brake *o* is attached to the drum *J* to regulate the speedy descent of the escape car.

Construction Notes.

We shall always be glad to receive items of interest for this column.

CONTRACTS AWARDED.

KINGS COUNTY, N. Y.—Proposals for alterations and additions to the county almshouse were opened at the office of the Clerk of the Board of Supervisors (court house, Brooklyn), on the 29th ult. The contract for carpenter and mason work was awarded to John Guilfoyle, for $20,580 and that for steam heating apparatus to J. Jacobs & Co., for $4,290. The other bids for steam heating apparatus were as follows:

James Armstrong	$4,500
J. W. Birkett	4,600
Geo. S. Elcock	6,574
H. F. Campbell	5,190
H. O. & W. A. Southard	5,639
Gillis & Geoghegan	4,990

The contract for repairs (chiefly painting) to armories occupied by the Thirteenth and Forty-seventh Regiments was awarded to C. H. Barry for $1,150.

PADUCAH, KY.—A contract amounting to $7,948 was awarded Dec 1, by the Supervising Architect of the Treasury Department to Messrs. Bartlett, Hayward & Co., of Baltimore, Md., for Hot Water Heating Apparatus for court house and post office, at Paducah, Ky.

CHARLESTON, VA.—A contract amounting to $2,326 was awarded by the supervising architect, Dec. 2, to Messrs. Knisely Bros. & Miller, of Chicago, Ill., for slating and galvanized iron work for roof of court house and post office, at Charleston, Va.

NEW YORK CITY.—Nine proposals for the construction of a sewer in Thompson street, between Third and West

Digitized by Google

Fourth street, were opened at the Department of Public Works, on Nov. 28, of which two were informal. The lowest bidder was Cornelius Smith, whose bid was $1,183. Twelve proposals were opened at the same time and place for the construction of a sewer in 73d street, between First avenue and avenue A, the lowest of which was by J. D. Miner, whose bid was $7,214.06.

—Schedule of Proposals for Mineral Oil and Lard Oil —opened at the office of the Light House Board, Nov. 28, 1882:

Recommended by Light House Board to Secretary of Treasury, that the Lard Oil be given to Stope & Co. Matter of award not yet determined by Secretary for either kind of oil.

NEW YORK.—The following bids for regulating and grading 117th street, between Fourth avenue and Fifth avenue, were opened at the Department of Public Works, on Nov. 28:

D. Dowd	$45,184.20
J. D. Miner	50,848.20
D. K. Gallagher	53,046.00
J. McGuire	55,431.20
W. Rhelan	37,915.40
J. H. Sullivan	43,662.00
P. Farley	35,778.00
J. McKim & Son	45,441.00
J. Slattery	42,665.40
J. H. Casey	36,787.20

The following bids for repairing the pier and bulkhead at the foot of 23d street, East river, were opened at the Department of Docks on the 4th inst:

John Gillies	$9,737
Richard Cronin	11,000
Jos. Walsh	11,400
Flaherty & O'Connell	9,495
John Monks	11,667
Warren Rosevelt	10,977
Frank Pigeon, Jr	24,950
Moses Engle	13,500
James D. Leary	10,989

For repairing the bulkhead and platform at the foot of 130th street and North river, there were four bids, of which that of Jos. Walsh was the lowest, viz., $2,349.

NEW WORK AND MISCELLANEOUS.

CHICAGO.—The Lincoln Park Board of Commissioners, on the 14th ult., directed the Superintendent of the Park to advertise for proposals for heating the refectory by same.

ST. JOHN, N. B.—T. McAvity & Sons are heating the St. John cotton mill with a system of steam pipes designed by a New York engineer. The coils are suspended from the ceilings and the apparatus is to be a gravity return. One of a battery of boilers is set apart for that purpose to be used at any pressure.

MT. MCGREGOR, SARATOGA CO., N. Y.—Proposals for mason work, carpenter work, plumbing and electric bells, for a hotel at Mt. McGregor, will be received by A. W. Fuller, 86 State street, Albany, until Dec, 10.

WASHINGTON, PA.—The Town Council of Washington, Washington Co., Pa., has been discussing the question of water supply. A year or two ago, the Legislature granted a charter to an individual, for the right to supply the town with water, but it appears to have been only a speculative enterprise and nothing has come of it. Any water supply must probably be obtained by pumping from Chartier Creek, which runs near the town. The population is about 6,000,

CHICACO.—The Cook County Electric Light Co. will begin work on the tunnel immediately.

NIAGARA RIVER.—The contract for building the new suspension bridge across Niagara River has been let to the Phœnix Iron Works.

BOSTON.—Proposals for furnishing plumbing materials for the post office and sub-treasury extension will be received at the office of Thos. Brown, Superintendant, until December 12.

ADRIAN, MICHIGAN, has not given up the hope of having water works. The Council are considering a proposition made by some Akron parties to build works and furnish water for public uses at $8,000 per avenue for 100 fire hydrants. The city have the privilege of laying the works inside of five years. The population of Adrian is about 1,100.

NEW YORK.—Estimates for hauling and laying a 48-inch cast iron conduit pipe in Westchester County, also for furnishing stop-cocks, stop-cock boxes and hydrants, will be received by the Department of Public Works, until December 27.

Estimates for flooring and other work on the Fulton Market will be received by the Department of Public Works until Dec. 14.

QUEBEC.—The Mayor and Corporation have appointed an engineer to report on the water supply. The city has received proposals from private parties to buy the water works.

A new water company has been incorporated at Red Bank, N. J. The company will be known as the Shrewsbury Water Company. The incorporators are State Senator Applegate, Judge John L. Wheeler, Anthony Reckless, Treasurer of the New York and Long Branch Railroad Company; Isaac B. Edwards, Cashier of the Second National Bank; Dr. Robert R. Conover, Edward E. Roberts, and J. A. Throckmorton.

THE NEW YORK TRADE SCHOOLS.

The Trade Schools (on First avenue, between 67th and 68th streets) of this city, opened on Monday evening last with about 80 members in the various classes. Many more are expected. There are no day classes, as there were not enough applicants to warrant the establishment of courses of day instruction. The classes in plumbing meet on Monday, Wednesday and Friday evenings. A part of one evening in each week is devoted to the study of the scientific part of the subject. A series of questions on this topic has been prepared, a part of which the instructor answers on these weekly occasions, carefully explaining them by blackboard drawings and requiring students to take notes in blank books furnished them, in which the questions are printed at the heads of pages. From these notes or memory the students are expected to prepare full answers to the questions and hand them in at the following meeting. These questions we hope to present to our readers subsequently. The instruction in plumbing is given by Mr. Hansom under the direction of the following master plumbers: Messrs. Muir, Pearson, Locke, and Byrne.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Notes and Abstracts.

For the week ending November 25, of a total urban population of 6,122,479, there died 2,434, corresponding to an annual death rate of 20.3 per 1,000, a little less than the preceding week, which was 20.8. The lowest death rate was in the River cities, where it was 17.1, and it continues low in the Lake region. Of the total number of deaths 33.3 per cent, were of children under five years of age. Diphtheria caused 29 deaths in Philadelphia, 15 in Buffalo, 12 in Detroit, and nine in Minneapolis. Small-pox caused deaths in Philadelphia, Chicago and New Orleans.

Taking the sum of the reports for the last five weeks, we find that for an average urban population of 5,923,747, the deaths were equivalent to an annual mortality of 20.4 per 1,000. For the same period in the North Atlantic cities the rate was 19.7; for the Eastern group, 21.4; for the Lake region, 17.8; for the River cities 19.3; and for the Southern cities—whites 18.8, colored 31.6. The deaths under five years were 35 per cent. of the whole, the lake and River cities, and the Southern blacks being above the average. The total number of deaths during this period from consumption was 1,727, being 14.5 per cent. of the whole. Acute lung diseases caused 10.3 per cent. of all deaths. Diphtheria 6.04 per cent., and typhoid fever 3.7 per cent. No deaths from measles were reported during these five weeks in the North Atlantic or the Southern cities. Small-pox in the Southern cities has been confined to the colored population. Only five deaths from puerperal diseases are reported in Southern cities; 16.9 per cent. of deaths of the colored population of these cities was caused by consumption, which disease caused 17.6 per cent. of the deaths in the North Atlantic cities, and only 10.8 per cent. in the Lake group.

BOSTON, MASS.—C. E. Davis, Jr., reports 65 cases of diphtheria, 28 of scarlet fever, and 14 of typhoid.

ALBANY, N. Y.—Health Officer, Daniel V. O'Leary, reports the prevailing diseases as scarlet fever, measles, and diphtheria.

DETROIT, MICH.—Dr. O. W. Wight reports 36 cases of scarlet fever and 87 of diphtheria.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 24 new cases of scarlet fever and 49 on hand; nine new cases of diphtheria and 29 on hand.

PITTSBURGH, PA.—Dr. Snively reports seven new cases of small-pox.

DAYTON, OHIO.—Dr. E. B. Davis sends delayed report for week ending Nov. 18. Total deaths six, under five years two. The only entry under the headings of our statistical table is, *Accidents* one.

INDIANAPOLIS, IND.—Dr. E. S. Elder reports several cases of scarlet fever, but no deaths from that disease during the week.

ROCK ISLAND, ILL.—G. G. Craig, Commissioner of Health, reports three deaths during the week, none under five years; population 11,650; no zymotic diseases.

JACKSONVILLE, FLA.—In reporting a death from *old age*, Health Officer, A. W. Knight, states the age as 103 by report.

Digitized by Google

SANDWICH, ILL.—Dr. Nahum E. Ballou reports the continuance of measles.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin's report shows 14 admissions, ten discharges, four deaths, and 1,346 remaining under treatment.

NEW YORK CITY.—The monthly report of Dr. B. H. McCann, the examining physician for the Board of Commissioners of Public Charities and Correction, shows that during the month 1,477 applicants for medical relief were examined, of which 14.55 were admitted to hospitals. Of these, 108 were cases of general diseases, 114 of fevers, 236 of diseases of the respiratory organs, 443 were surgical cases, and 142 of alcoholism. The number of male adults was 870, of female adults 580, and of children 5.

BALTIMORE.—The total number of deaths for the week ending Nov. 25 was 157, of which there were 132 white, and 25 colored. The Health Officer reports from this the annual death rate as 19.96 per 1,000—being for whites 19.66, and for colored 26.66. The true death rate was about 23.4. There were 21 deaths from small-pox, 21 from consumption, seven from croup, 25 from diphtheria, one from malarial fever, and one from typhoid fever, four from scarlet fever, and seven from pneumonia. The number of deaths under five years was 76, or over 50 per cent. of the whole number of deaths.

DETROIT, MICH.—The immigrant inspector's report of Dr. J. J. Mulheron shows for the week ending Nov. 25, the interception of 682 immigrants, of whom 623 were found protected; 59 required vaccination; of these five were primary cases.

PORT HURON, MICH.—The immigrant report of Dr. H. R. Mills, for the week ending Nov. 25, shows that 684 inspections were made, and 468 vaccinations performed. Most of these were Canadians; 128 were found protected by a previous attack of small-pox, and only 80 by vaccination: 98 primary vaccinations were performed, 63 of the cases being over five years of age.

PROVIDENCE, R. I.—Dr. E. M. Snow reports the typhoid epidemic as decreasing. There were 103 cases of the disease reported during the week, but of these only 16 were new cases—that is, cases which began during the week. During the period from Oct. 1 to Nov. 25, there have been 431 cases.

DISTRICT OF COLUMBIA.—Dr. Smith Townsend reports that during the month of October there were 356 deaths, equivalent to an annual rate of 22.58 per 1,000. This rate is 72 less than the mean death rate for October during the past nine years. Of the decedents 180 were white, and 176 colored; white rate 17.32; colored 32.78. Children under five years constituted 39 per cent. of the total mortality. There were 56 deaths from consumption, 18 from malarial fever, nine from typho-malarial fever, 17 from typhoid, 13 from diphtheria, three from croup, three from scarlet fever, and one from cerebro-spinal fever.

MICHIGAN.—Dr. H. B. Baker, Secretary State Board of Health, reports, as the results of observations of 53 observers in different parts of the State, the following diseases in the week ending Nov. 18 in the order of greatest area of prevalence: neuralgia, rheumatism, intermittent fever, bronchitis, consumption, and tonsillitis. The reports show an increase in the areas of typhoid fever, pneumonia, and neuralgia. Diphtheria was reported present at 24 places, scarlet fever at 13, measles at three, and small-pox at two places.

CALIFORNIA.—Dr. F. W. Hatch, Secretary State Board of Health, transmits the Monthly Circular for October, dated Nov. 13. The mortality table is confined mainly to localities in the interior of the State, the large cities of the coast not having been heard from at the date of issue. In a population of 94,372 there were 116 deaths, equal to an annual rate of 14.76. Of these, 24 were caused by consumption, nine by acute lung diseases, three by diarrhœa, three by cholera infantum, three by typhoid, three by malarial fevers, two by croup, and one by diphtheria. There were no deaths from scarlet fever, measles, small-pox, or whooping cough. But one case of diphtheria is reported from Sacramento, this being the only contagious disease noticed in the reports from sixteen localities.

ONTARIO, CANADA.—The weekly Health Bulletin of the province shows the following diseases in the order of prevalence during the week ending Nov. 18: Bronchitis, neuralgia, influenza, anæmia, diarrhœa, and consumption.

BERMUDA, WEST INDIES.—Consul Charles M. Allen, under date of Nov. 14, states that the fever heretofore reported continues to some extent; no deaths have occurred from it. A physician is rarely employed, and the patient is sometimes not even confined to his house.

SANTIAGO DE CUBA.—Consul Landreau reports for the month of October, 44 cases of yellow fever and 31 deaths from the disease. The harbor and its vicinity are not inspected.

AUX CAYES, HAITI.—Thomas Dutton, Consular Agent, reports a total of 12 deaths during the week ending October 28. Of these seven were caused by small-pox. No cases of yellow fever are reported.

VICTORIA, VANCOUVER'S ISLAND, B. C.—Consul Allen Francis reports the prevailing diseases during the week ending Nov. 11, as typhoid fever, pheumonia, and diphtheria. Small-pox is said to be present among the Indians on the mainland.

ENGLAND.—The return of the Registrar-General for the week ending Nov. 11, shows the average mortality rate in 28 towns to have been 21.7 per 1,000; lowest rate in Brighton, 12.9; highest in Sunderland, 32.4; London, 20.0. The 27 deaths from diphtheria in 28 towns included 19 in London. Small-pox caused four deaths in London, one in Wolverhampton and one in Newcastle-upon-Tyne. In London there were 217 deaths from zymotic diseases in a total of 1,493. In addition to the deaths from small-pox and diphtheria already mentioned there were 57 from measles, 70 from scarlet fever, 13 from whooping cough, one from typhus, 32 from typhoid, four from ill-defined forms of continued fever and 17 from diarrhœa and dysentery.

SCOTLAND—Consul Leonard transmits the Registrar-General's return for the week ending Nov. 11. The aggregates appear in our statistical table of the eight principal towns, giving an average rate of 22.0 per 1,000; the lowest mortality was recorded in Leith, viz., 16.4, and the highest in Dundee, 27.2, in which town measles, diphtheria and whooping cough are prevalent.

IRELAND.—Consul A. B. Wood, of Belfast, sends the Registrar-General's return for the week ending Nov. 11, the aggregates of which will be found in our weekly table. Typhus caused six deaths, of which three occurred in Dublin, two in Cork and one in Londonderry. The death from small-pox occurred in Belfast. The deaths from scarlet fever were confined to Dublin and Belfast.

ST. PETERSBURG, RUSSIA.—Consul-General Edgon Staunton reports for the week ending Oct. 28, a mortality of 526; males, 286; females, 240; under five years, 240. Small-pox caused nine deaths, typhus one, and typhoid 10 deaths. The patients in hospitals on the 29th numbered 5,823; among these were 458 cases of fever, 55 of small-pox and 1,134 of venereal diseases.

ROTTERDAM, NETHERLANDS.—Consul John F. Winter reports 11 cases of small-pox and four deaths from the disease during the week ending Nov. 11.

SPAIN.—The statistical bulletin for the month of July last for the Spanish peninsula reports 41,965 deaths, being an annual mortality rate of 24.9 per 1,000. Twelve hundred and ninety-five deaths were due to small-pox, which caused 30.8 out of every 1,000 deaths. Typhoid fever caused 10.96, intermittent fever, 10.89; and consumption, 46.04 per 1,000 of all deaths.

WARSAW, RUSSIAN POLAND.—Consul Rawicz reports 17 deaths from small-pox during the week ending Oct. 28.

CONSTANTINOPLE.—Consul-General G. H. Heap, under date of Nov. 7, transmits copies of telegrams received by the sanitary administration of the Ottoman Empire announcing the appearance of cholera among the pilgrims at Mecca, on Oct. 24. All precautions are being taken at the quarantine stations on the Red Sea.

JEDDAH, RED SEA.—Under date Oct. 31, Dr. Wortabetz reports that cholera has broken out once more this year at Mecca. On the 24th of the month, two days after the great feast of Kouzbaw Bairam cases of the disease were seen and up to the 26th 10 proved fatal. It is said, however, that the present outbreak is a mild one. The disease was brought to Jeddah on the 27th by pilgrims from Mecca. One death occurred on the 28th, one on the 29th and one on the 31st. At Mecca, up to and including the 29th, 159 deaths had occurred.

BOMBAY, INDIA.—Consul B. F. Farnham sends reports for the weeks ending Oct. 10 and 17. During the former there were 402 deaths, giving a ratio of 24.0; 88 of these deaths were from remittent fever. During the latter there were 401 deaths giving a ratio of 23.94; 67 were from remittent fever.

MADRAS, INDIA.—Consular Agent, L. Strange, reports for the week ending Oct. 13, 228 deaths in a population of 397,552, giving a ratio per mille per annum of 29.8. Fevers caused 61 deaths, dysentery 29, diarrhœa 16, small-pox four and measles one. No deaths are recorded from cholera. In the report for the following week ending Oct. 20, the ratio is 33.7. The total deaths were 258, of which 67 were caused by fevers, 31 by dysentery, 10 by diarrhœa and 6 by small-pox. No cholera.

CALCUTTA, INDIA.—Consul General H. Mattson sends reports for the weeks ending Sept. 30 and Oct. 7. During the former 225 deaths occurred, during the latter 204, giving the respective rates of 27.1 and 24.5 per 1,000. The reports show 20 deaths from cholera, 15 from typhoid fever, 58 from diarrhœal diseases, 62 from tetanus, 17 from consumption and 1 from diphtheria.

BATAVIA, JAVA.—Consul Oscar Hatfield transmits two cholera reports from the province of Sourabaya for the ten days ending Sept. 10 and 20. The former shows four cases carried forward from the previous report and 66 new cases, making 70, of whom 60 died, 8 recovered and two remained under treatment. The latter shows 73 new cases, making 75, with those remaining from the previous week; of these 58 died, 8 recovered and 9 remained under treatment. Consul Hatfield also sends a consolidated report from all the provinces of the Island for the month of July, showing 2,278 new cases of cholera and 1,294 deaths from the disease.

Twenty cases of typhoid fever have occurred in East Dedham. The doctors find the cause in impure water and imperfect sewerage.

A CORRECTION.—In noticing the closets provided by the Brown & Sharpe Manufacturing Co. last week we gave their location as Hartford, Ct. We should have said Providence, R. I.

Tables showing the number of new patients at six New York City Dispensaries, for the week ending Nov. 25th, 1882, with some of the principal acute diseases:

Six New York Dispensaries have furnished reports for the week ending November 25th. These report 2,268 new cases, of which 1,113 were of acute diseases. The proportion of lung diseases has increased from the preceding week; the malarial fevers have markedly diminished; 5 cases of diphtheria and 5 cases of tonsillitis are reported.

"ST. NICHOLAS."

The Christmas number of the "St. Nicholas" is filled with cheer and spice for Christmas tide. The frontispiece "with the compliments of St. Nicholas," is bright with color, and children will read with delight the stories, some full of the fantastic imagery of fiction, or others that are "really true," and even children of a larger growth may declare with the grotesque lad in the Letter Box, "There isn't a dry page in it." The contents embrace "The Story of Viteau," and "The Banished King," from the pen of Frank R. Stockton. "Christmas Fairies" that come in the shape of silver pieces. "The Mammoth of St. Petersburg," J. G. Francis "Changing a Face," a noteworthy sketch of the little "mice muscles" that creep about so many childish faces, and often spoil their sweetness. "The Field of the Cloth of Gold," by E. S. Brooks, a number of poems brief and pithy, illustrations to suit humors grave and gay, and a Christmas Carol.

The publisher of THE SANITARY ENGINEER will esteem it a favor if names of persons likely to be interested in the journal are sent to him, in order that he may send them specimen copies.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

Pure Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

THE NEW

PHARMACOPŒIA

Of the United States,

Contains certain new preparations, and requires greater purity in nearly every case.

Anticipating a large demand for really first-class

LABORATORY PRODUCTS,

which shall meet the strictest requirements of the new Pharmacopœia, we have greatly increased our

MANUFACTURING FACILITIES,

and can now offer a large line of proper strength and purity.

– SPECIALTIES: –

FLUID EXTRACTS.

In accordance with the new requirements, *each cubic centimetre represents one gramme of powdered drug, or each minim represents 95-100 grain of powdered drug.* As the strength of these preparations has not been materially changed, the doses need not be changed. Our Fluid Extracts are made by repercolation without heat, of full strength, and from good materials, with solvents adapted to the individual drugs.

SOLID EXTRACTS.

Excessive heat is avoided, and these extracts fully represent the soluble active constituents of the powdered drugs.

POWDERED EXTRACTS,

Of the same strength as the Solid Extracts, and in many cases more convenient for dispensing. Our line includes all for which there is a demand.

ABSTRACTS.

A class of Powdered Extracts introduced into the new Pharmacopœia. *One grain of Abstract represents two grains of the powdered drug.* DOSE:—One-half that of the drug, or one-half as many grains as the dose, in minims, of the fluid extract. The simple relation between the dose of drug and of abstract will, we believe, commend this new class of preparations to physicians. We can now furnish a considerable number of abstracts, and will manufacture all for which a demand arises.

SCALE PREPARATIONS.

All scales containing Quinine, Strychnine, or other alkaloids, are assayed by our Chemist, and we guarantee them to contain the full amount of alkaloid stated on the labels. We call especial attention to the following:

Citrate of Iron and Quinine, U. S. P.—12 per cent. Quinine, 90 Ammonia, slowly but completely soluble in water; color, ruby-red.

Citrate of Iron and Quinine, Soluble.—10 per cent. Quinine, with Ammonia; very freely soluble in cold water; color, light green.

Citrate of Iron and Ammonium, U. S. P.; Citrate of Iron and Strychnine, U. S. P.; Citrate of Iron, Quinine and Strychnine.—10 per cent. Quinine, 1 per cent. Strychnine, with Ammonia.

All other scales of the Pharmacopœia.

MISCELLANEOUS.

Purified Salts, Bisulphate of Quinine, Sweet Spirits of Nitre, all grades, Iron Preparations, Purified Chloroform, Etc.

W. H. Schieffelin & Co.,

WHOLESALE DRUGGISTS AND MANUFACTURING CHEMISTS,

170–172 William St., New York.

A SOUND POLICY.

PURE SPICES ONLY.

Some manufacturers and dealers allege that it is necessary to give a large weight or bulk for a certain amount of money, hence the admixture of many worthless, if not hurtful, compounds. Now we do not believe in this argument, and while there may be some demand for "a big package for a small amount of money," we rate the intelligence of the American people too high to believe that they prefer to have half a pound of adulterated spice instead of a quarter of a pound of pure spice containing the same strength. As well might the consumer prefer a quart of water mixed with an equal quantity of milk at a higher price for the two quarts of mixture than for the one quart of milk. We therefore put up

PURE SPICES ONLY,

and leave it to others to furnish adulterated spices, if any are required. We some time since dropped from our list the Griswold's O K and I X L brands, retaining the "*Thurber's S. I.*," and "*Massasoit Mills*" brands, the former being an extra grade of the finest, freshest and strongest spices, especially Selected and Imported, hence the brand (S. I.), for the finest trade; while the "*Massasoit*" brand will represent strictly pure goods of good quality. Both of these brands will be put up *full weight*, thus heading off another swindle frequently perpetrated upon the consumer, and to meet the demand which may legitimately exist for a package of spice for a small amount of money, we have concluded to put up, in addition to the larger size, *a two-ounce round tin, with sifting top*, which we guarantee contains more real value than the usual four-ounce tin of adulterated spices, the only condition necessary in the use of pure spices being to use less of them.

We expect that consumers will, and, indeed, they have, sustained us in taking this stand. Reputable dealers prefer to sell only full weight and genuine goods. Competition from the unscrupulous sometimes induces them to keep good, bad, and indifferent. We rely on the intelligence of consumers to encourage them to keep first-class articles. Ask therefore for

Thurber's S. I. Spices.

They are put up in two, four, eight and sixteen-ounce tins. *Always full weight.*

Scribner & Welford's
New Books.

Superbly Illustrated Books.

A Companion Volume to "Venice."

FLORENCE. Its History—The Medicis—Its Scholars, Architecture, Paintings, Sculpture, etc. By Charles Yriarte. Illustrated by over 500 photogravures and engravings. 1 vol. folio, richly bound in cloth extra, gilt edges, morocco backs, $20; or in full morocco, extra gilt, $28.
This sumptuous volume, perfect in every attribute of elegance, fitly supplements the author's artistic work on "Venice," the success of which was something phenomenal. Dealing with the great Art City of Italy, the home of Dante and Michel Angelo, the centre of all that is purest in architecture, painting, and sculpture, with an influence extending throughout the world, "Florence" well deserves to be loved and unceasingly studied. This volume is confidently placed before the public as having few equals in the domain of illustrated literature.

THE HISTORY OF FASHION IN France; or, The Dress of Women from the Gallo-Roman Period to the Present Time. From the French of M. Augustin Challamel. By Mrs. Cashel Hoey and Mr. John Lillie. 1 vol. imperial 8vo, with 21 richly-colored and illuminated plates, containing 84 distinct figures and varieties of costume, richly bound in imitation satin-wood, extra gilt, $10.
Fashion is the expositor, from the standpoint of costume, of our habits and our social relations; in a word, of everything pertaining to the charm of life. It has its value as a moral sign-post, and supplies the historian, the philosopher, and the novelist with a guide to the prevailing ideas of the time. This work is of *genuine importance* as a comprehensive history of the subject and of *universal interest*, appealing to every class and nation. In a clear and graphic style, lightened by frequent social and illustrative anecdotes, the author follows thoroughly the course of Fashion from the "patel dye" and "tattoo" of the primitive Gauls down to the more graceful and artistic effects of the year 1880, while the eighty-one distinct figures, brilliant in colors, supply abundant pictorial embellishment. A new and unique binding of exceptional beauty and effectiveness renders the book as a whole all that can be desired.

JAPAN. Its Architecture, Art and Art Manufactures. By Christopher Dresser, F.L.S., &c. With over 200 Illustrations. Square 8vo, unique stamped, crash binding, gilt top, $10.
*** The only book published on Japanese *Art Manufactures*; which Dr. Dresser went to Japan purposely to study, and no one can understand the subject or *buy* judiciously without knowing this book. The illustrations are by Japanese artists and the best ever done.

*ANCIENT GREEK FEMALE COS*tume. Illustrated by 112 Plates and numerous smaller illustrations, with explanatory letterpress and descriptive passages from the works of Homer, Hesiod, Herodotus, Æschylus, and other Greek authors, selected by J. Moye Smith. 12mo, cloth, $3.

GLASS IN THE OLD WORLD. By M. A. Wallace-Dunlop. With illustrations, colored and plain. 8vo, cloth. London. $5.00.
*** CONTENTS.—Ancient Egyptian—Phœnician and Greek—Roman—Assyrian—Hebrew Glass—Persia—Etrurian, Pompeiian and Christian—Byzantine and Arab—Chinese, Japanese and Indian—Great Britain and Ireland—French, Spanish, German and Italian—Imitation Gems—Windows—Mosaics and Wall Decoration—Cups—Beads—Mirrors—Lamps—Of True and False Murrhine, and Flexible Glass—Analysis, Oxides, and Glazes—Notes, etc—Index.

ELECTRO-MOTORS: A Treatise on the Means and Apparatus Employed in the Transmission of Electrical Energy and its Conversion into Motive Power. For the use of Engineers and others. By J. W. Urquhart. With numerous illustrations. 16mo, cloth, $3.

*THE PRINCIPLES OF GOTHIC EC*clesiastical Architecture, with an Explanation of Technical Terms and a Centenary of Ancient Terms. By M. H. Bloxam, author of "A Glimpse at the Monumental Architecture and Sculpture of Great Britain." With numerous wood-cuts, mostly by Jewitt. Vol. III. contains an Account of the Vestments in Use in the Church to the end of the reign of Edward VI. 3 vols. crown 8vo, cloth, $9.

*** The above books are for sale by all booksellers, or will be sent upon receipt of advertised price. Catalogues of rare and curious second-hand books, and detailed lists of our regular stock, which includes all important *Scientific Works*, will be sent on application by

is Not Generally Known.

not generally known that we manufacture, or deal in nearly everything that is eaten ık, and that consumers can, if they will ·ir grocer to procure it for them, get any- hey want under Thurber's brand We do ow our name to be placed upon any goods e not of good quality and full weight. It efore to the interest of consumers to ask urber's brands. Some grocers very short- lly handle other brands because they can a larger profit, but they lose sight of the ant fact that what they make in the larger ı of profit, they lose in the smaller volume siness. Not every consumer knows just rands they can rely upon, but we guarantee ds sold under our name to be of superior , and authorize dealers to refund the se price in any case where the consumer use for dissatisfaction. It is therefore to erest of both dealer and consumer to use er's brands, and they can get almost every- under our brand if they will ask their for it.

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

STEWART'S PAT. VENTILATING TRAPS

IN STONEWARE AND IRON.

Simple in construction. No Valves to get out of order. Automatic in action. Cheapest and best ever introduced. One placed as an INTERCEPTOR between house and street sewer, or Cesspool, will positively exclude foul air from any house. *WE GUARANTEE THIS.*

Price Lists and Testimonials mailed by STEWART & CO., MANHATTAN POTTERY, foot of West 18th & 19th Streets, and 312 Pearl Street, cor. Peck Slip, New York.

RECENTLY PUT INTO THE WHITE HOUSE BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 *Superior Street*,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL **S** TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

THE

RIDER COMPRESSION

PUMPING ENGINE,

(Hot Air),

For city or country residences where it is required to raise a supply of water, is the most *Perfect Pumping Machine* in the market. Its marvellous *Simplicity*, absolute *Safety*, great *Economy* and *Effectiveness*, render it far superior to all others. Can be run by any inexperienced person. Send for catalogue and price list to

CAMMEYER & SAYER,

93 Liberty St., New York,

and 20 W. Lake St., Chicago, Ills.

Please mention this Paper.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220

Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275

Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375

Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

H. A. ALLYN & CO., Managers.

CREQUE'S PATENT

New Circulation

RANGE BOILERS

13 different styles—adapted and warranted for every possible situation.

ESSENTIAL FEATURES.

1st. Cold water is introduced at the bottom of the boiler, while hot water is injected into the top of the boiler.

2d. By this system the chilling of the hot water in its passage to the top of the boiler is avoided.

3d. Hot water being stored at the top of the boiler without chilling, it can be used immediately; thus making the boiler serviceable as soon as the water-back is heated.

4th. The circulation is positive in direction and rapid in action, and heats in very much less time.

5th. Circulation being positive, there is no cracking, snapping or rumbling in the boiler.

6th. There being no reversal of circulation, there is no sudden expansion and contraction of the boiler shell. The boiler will therefore wear longer.

7th. In case of a part of the boiler being filled with steam, a sudden injection of cold water does not condense it, as the injection is at the *bottom* of the boiler, thus forcing the heated water above it to fill the space left by escaping steam, when a hot water cock is opened.

8th. A considerable saving in material and labor in cost of setting up the boiler and connecting pipes.

9th. In consequence of a rapid, invariable and constant circulation, much more hot water can be obtained from a small sized boiler than from a much larger boiler of the old method of circulation. These boilers are arranged to meet every conceivable requirement of location or condition. To both the plumber and architect this is a great advantage, while it also lessens the cost to the builder.

N. B.—Please send for Catalogue fully explaining the various situations for which these boilers are intended.

The "EUREKA" Wheel

Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which in other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.
The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.
The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.

Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street, PHILADELPHIA, PA.

Over 100,000 *now in use!*

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)

ATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open, steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

VOLUME 7.
NUMBER 1.

SUPPLEMENT.

NEW YORK,
DEC. 7, 1882.

OFFICIAL SUPERVISION OF PLUMBING IN WASHINGTON.

We give below very full abstracts of the report of Mr. Samuel A. Robinson, the Inspector of Plumbing of the District of Columbia, to the Health Officer of the District. Some portions of the report may be considered as somewhat elementary, yet we presume it was written for the householders of the District, who evidently need instruction. An examination of the illustrations we reproduce on the following pages should convince every one of the necessity of official supervision of plumbing.

We have taken some pains to inquire into the character of the services rendered by Mr. Robinson, and are satisfied that he is doing a most valuable work for the citizens of Washington.

His report reads as though it were written by a man who took an interest in his work. We believe he does and that he should have more assistance, a decent and healthy office, and substantial evidence that the services of a capable and honest plumbing inspector are appreciated.

HEALTH DEPARTMENT.
OFFICE OF THE INSPECTOR OF PLUMBING,
WASHINGTON, D.C.

SIR: I have the honor to make the following report of the operations of this office, during the fiscal year ending June 30, 1882, embodying such recommendations and suggestions as, in my opinion, will increase the efficiency of the service:

Five hundred and forty-two permits have been issued for the erection of new dwellings, plans of which have been submitted by the owner, architect or plumber for examination and approval.

Seven hundred and two permits have been given for making connection with the public sewer.

Nine hundred and fifty-six inspections have been made by me of the plumbing work in dwellings, including alterations and changes in the drainage system of old houses.

Not less than three inspections of the plumbing work in every new house is made by me before completion, and sometimes as many as four inspections are made in the case of alterations in old houses. This latter work requires more time and attention than any other part of my duty, as I am frequently called upon for detailed reports.

The fact that our city was the first large American city to adopt intelligent regulations governing plumbing and house drainage, and that we have been met by cordial public support in applying the rules to practice, is a matter for congratulation.

Since August the first, 1881, the time when our regulations went into effect, several cities, notably New York and Brooklyn, have adopted substantially the same forms, with modifications suited to local usage.

In some respects our rules should be revised, especially in respect to drains under dwelling houses. In both Brooklyn and New York, the use of earthen drains is prohibited. Upon this point I have given my views more fully in a communication of ——— to the Department. To require only heavy cast-iron pipe inside of the building line is absolutely necessary in order to avoid soil pollution, and consequent danger to health, and is consistent with approved practice in other cities.

The earthenware drain should end at about five (5) feet outside of the foundation walls of the house; the joint between the iron drain and the earthenware pipe should be made with pure hydraulic cement, and where the iron pipe passes through the wall, a relieving arch should be built over it to prevent the pipe from being broken by the settlement of the walls, which often occurs. Important as it is to have drains outside of the house free from sediment or leakage, it is still more so to have all the pipe joints inside of the house perfectly air and water tight, and to insure this the plumber should always stop the openings and fill the pipe with water, before a notice is sent to this office for an official inspection of his work.

The danger of water pollution by direct connections of water closets with domestic service pipes, is a matter of serious importance, and this practice (which is a common one) should be prohibited.

The practice which was common in former years, of connecting two or more houses with one private drain, is now giving us a large harvest of trouble, which is at present beyond the power of this Department to remedy.

Suitable legislation should be invoked for the abatement of this very serious evil by requiring separate house connections and the total abandonment of these foul and defective sewers. Several aggravated cases, pointing to sickness and death, have come under my notice, but I have had no power to alleviate the trouble, except by voluntary conversions of all interested parties.

There are also a large number of houses which have no sewer connections, but drain into dry wells and cesspools, polluting the soil of the entire vicinity surrounding. These wells were constructed long before the present sewerage system was adopted, and are still in use in localities where connections with public sewers may conveniently be made. Although there is no law to compel property owners to construct sewers in front of their houses, in all cases where there is no appropriation for such work, it is the rule of the Engineers' Department to furnish the material and construct a sewer, upon the payment of one-third the estimated cost by the owners of property benefited.

I earnestly recommend an investigation of all houses not connected with the public sewers, and that active measures be taken to extirpate these foul cesspools and wells.

As parties have objected to the running trap and cold air vent, on the line of the main drain, and in some cases, I am informed, have closed up the latter, imagining that injurious effect would result from having them in front of their houses, it would perhaps be well to say something about the advantages to be derived from these modern appliances, and the reasons for their adoption.

In order to effect a constant movement and change of air in the pipes two openings are required, an outlet and an inlet. The extension of the soil pipe through the roof affords an escape of the foul air generated in the sewer, by the decomposition of foul organic matter clinging to the inner surface of the pipes. In order to render harmless this matter undergoing putrefaction, a constant introduction of pure air from the outside is absolutely necessary, and as the soil pipe is warmer in winter (being in the house) than the fresh air pipe, located near the ground in front, the result is an almost constant upward current in the soil pipe.

This I have found to be the case even with the soil pipe on the outside of the house, for the reason that it is heated more by the sun than the fresh air pipe near the ground.

Most persons are familiar with the running trap, which is practically a bend in the drain, holding a sufficient quantity of water to prevent the passage of air or sewer gas from the street sewer to the house drain. This, in conjunction with the cold air vent, gives perfect security against the public sewer.

The law now requires every new house to be connected with the public sewer, and consequently even a small house is generally fitted up with a kitchen sink, a water closet, and sometimes a bath tub, while in a more expensively built residence, arranged with a more costly system of plumbing, we find, in addition to the above, stationary wash stands, near sleeping apartments, a number of bath and dressing rooms, having in them water closets, urinals, foot tubs, bidets and other fixtures.

The regulations of this department apply, with as much force, to the drainage and plumbing of small houses as they do to the most costly residences. The same protection is given to all, and as these rules have been established for the proper drainage and plumbing of houses, the public may rest assured that, when they are carefully observed and strictly complied with, there can be no danger of escape of sewer gas or foul odors in their dwellings.

* * * * *

It has frequently come within my notice in making inspections of houses already occupied, that owners insist that their plumbing must be all right, as they have paid ruinous plumbers' bills; that they know their sewers are all right, as they made the plumber put in one twice as large as he was going to—the popular idea of a good sewer being in exact proportion to the size thereof.

Owners should inform themselves somewhat as to the proper methods, and require plumbers to explain the purpose of all the pipes used; doubtless, that would sometimes puzzle even the architect. Plumbers are frequently embarrassed by being called upon to examine work done by themselves, within the past few years; instead of frankly condemning it and admitting that, at that time, they were not possessed with the full sum of human knowledge in matters of sanitation, they make the mistake of saying that the work was well done, and do not advise a change. The community must know that plumbing methods of five years ago are quite inadmissable now.

* * * * *

A four-inch house drain, if well graded, will carry off all the rain fall—which is the measure of the largest demand upon it of an ordinary city house and lot. A 6 inch drain will serve the largest house. There are now hundreds of houses in this city having eight and ten-inch drains, and an instance has recently come under my notice, in searching for a cause of death from diphtheria, of a 12-inch sewer run in especially to drain one house, and it is unnecessary to say that the two and seventy stenches of Köln were a sweet smelling savor compared to this abominable stinking thing.

As regards the set fixtures generally used in houses, I have but little to say, as it would require too much space to discuss the merits and demerits of the large number of patented devices now in use; but I must not omit to say that a house fitted up with a pan closet of whatever pattern, in a sanitary point of view, is unsafe, no matter what care has been taken to ventilate the soil and waste pipes. The most offensive part of the pan closet is the receiver or cast iron container under the bowl, for the solids gradually accumulate on its sides; this filth soon undergoes decomposition, and the gases that are confined between the pan and the trap escape into the apartment whenever the closet is used. To remedy all the defects of the pan closet by enameling, ventilating containers, and having special flushing arrangements, would make it more expensive than any of the modern closets now in use. I cannot too strongly condemn the use of pan closets, and hope they will be prohibited in dwellings by an intelligent public sentiment.

Many cases of complaint coming to this office of offensive odors in houses, point directly to the stationary wash tubs in laundries, made of wood, and always found to be a source of impurity. A moment's consideration will convince any one that a vessel which is to be used for laundry purposes should be made of a material which is non-absorbent. The disagreeable odors which arise from the absorption of the dirty, soapy water in the fibre of the wood, and which are always perceptible upon opening the basement doors in the morning, must be deleterious to the health of all in the house. I therefore strongly urge that the use of wooden wash trays and sinks be prohibited.

The less amount of woodwork about set fixtures of any kind the better, and every aid should be given to cleanliness by having them exposed to light and air. This is generally under the control of the architect whose mistakes in planning has been the cause of incurable evils, and much unnecessary trouble to housekeepers in so boxing fixtures as not to admit of frequent and thorough scrubbing. The location of plumbing fixtures in dark corners, under stairways, and in closed closets, should always be avoided.

The 4-inch flat trap now so commonly used in areas, and even in cellars, is one of the filthiest contrivances and vilest deceptions known to the plumbers' trade. It has no merit either as a seal to keep down the foul odors from the sewer, or as a safe exit for the surface water that may fall or run into the area. We as often see the top off as on, and when in place the dip or seal is filled with decomposed vegetable matter or dirt, so that it becomes more offensive and injurious to health than no trap at all. When it becomes necessary to have drainage for areas, I recommend an ordinary S-trap under the ground, with an iron grating over it, so constructed as to carry off freely all drainage or surface water.

I have in answer to calls from householders, and parties wishing to buy or rent houses, made a large number of inspections of dwellings built before the Act of Congress was passed authorizing the appointment of an Inspector of Plumbing. Many of these have been good houses, some among the finest in the city, well built and kept in good repair, yet not one of the number was found free from defects, more or less serious in their plumbing and drainage, and in most of them careful examination revealed most frightful conditions, as is shown by the accompanying drawings. (See next page.)

Drawing marked *A* shows condition of plumbing and drainage in dwelling on I street between 12th and 13th, previous to being remodeled.

Drawing marked *B* shows condition of one of a row of houses on Capitol Hill, showing defective plumbing and drainage and no ventilation. This is a fair representation of the old plumbing work in many of our small dwellings.

"*C*" shows condition of drainage and plumbing in a first-class residence on 17th street, N.W.

"*D*" shows condition of one of a row of houses in the south-east part of the city. No traps to any fixtures in the house, and underground drainage defective.

"*E*." Condition of stationary wash stand as found in first-class dwellings.

"*F*." Pan closet.

"*G*." Water closet trap with hand hole cover loose, and half off.

"*H*." Defective connection of kitchen sink, showing necessity for brass thimble and plumbers' wiped joint in connecting lead with iron pipe and T branch with ⅛ bend on line of main drain in cellar.

One would suppose that the work was intentionally designed to do as much mischief as possible. If householders would only realize the dangers from such practical examples of stupidity and criminal negligence, there would be such a demand for houses, free from these defects and properly constructed, that owners of property would soon see it was to their interest to expend the sums necessary to secure thorough work done in accordance with the regulations of this department.

Unprincipled plumbers can be found who will run the risk of being taken to police court—they may escape detection, but the householder is the sufferer in being

subjected to the dangers that arise from bad workmanship and a faulty system of plumbing.

The numerous applications of tenants, owners and prospective purchasers, for inspections of houses already built show an increased interest of the public in all matters pertaining to sanitation. Such inspections usually require detailed reports, frequently embodying recommendations and plans for remodelling, and as my office hours are fully occupied with consultations and inspections of plans, I am compelled to do a large part of my work at night at my own residence. I am frequently called upon at unreasonable hours to investigate some real or imaginary trouble, when more properly the parties should have sent for a plumber who could have charged for service. Yet I do not think it advisable to attach a fee for inspections and examinations from this office, as the Government should offer the fullest opportunity for the detection of danger to the public health. While the Act of Congress authorizing an Inspector of Plumbing did not contemplate such inspections of old houses, yet it is of the highest importance for the protection of the public health, and properly the work of this office, but as I have no assistance, many of these applications must necessarily be neglected.

Two years ago a gentleman called upon me to make an inspection of his house, stating that it was occupied by a member of Congress, who had complained of offensive odors arising from the set fixtures in the house. I made the examination and reported as follows:

"Drainage system defective, and without ventilation either for sewer, soil or waste pipes, and in some cases no traps under fixtures. I recommend that the necessary alterations be made at once, and that the offensive pan closet under stairway in basement, and the stationary wash stands in sleeping apartments be removed. In its present condition the house is unsafe."

As there were no regulations, at that time, governing such work, no attention was paid to my suggestions, and the only work done was to ventilate the soil pipe into the furnace flue. So soon as the tenant moved out of the house, the owner, with his family, consisting of his wife and two children, took possession. To-day those children are at the point of death with a malignant case of typhoid fever.

The father called a few days ago, giving me the information about the condition of his children, and expressing great regret that he had failed to comply with my suggestions of two years ago, begged that I would go with him to the house, and point out what could be done to give temporary relief, until such time as he could have the necessary alterations made.

He confessed that, besides the remorse of conscience, and perhaps the fatal termination of the sickness in his family, the bill for medical attendance, medicine, etc., would be four times what would have been required to put his house in perfect sanitary condition.

While my efforts to enforce the regulations have been kindly received and cordially aided by a majority of the registered plumbers, yet there are those in the business who apparantly take advantage of the great demand on my time, and do their work badly, and run the risk of detection. These men will express their willingness to correct the same when discovered.

Again there are a class of plumbers not bonded and registered, who are encouraged to violate the law, by property owners, who are satisfied to have cheap work done in tenement houses, not caring for the health or comfort of their tenants.

In order to break up these and other bad practices, and to obtain uniform methods for the security of the general health, this office should be reinforced by two or three assistant inspectors, and I respectfully suggest that such appointments be made, at the earliest practicable moment. These assistant inspectors should be young men of good character and address, and appointed upon the unanimous recommendations of a board, consisting of one professional sanitarian, one master plumber, and one journeyman plumber, and the requirements should be practical skill in plumbing, and sufficient knowledge to satisfy the board of their fitness.

I desire to return my thanks to the Honorable Commissioners, and to the officers of the Engineers and Health departments for their hearty support in my efforts to execute the duties of my office, and I trust they will soon take the necessary steps to secure efficient assistant Inspectors, so that the rules may be enforced equally upon all, and that the greatest good may follow the efforts now being made to bring about sanitary reform in the construction of our dwellings.

Very respectfully, Your obedient servant,

SAM'L. A. ROBINSON,
Inspector of Plumbing.

DR. SMITH TOWNSEND, *Health Officer.*

THE ANALYSIS OF AIR, WATER AND SOIL.

A correspondent of *Medical News*, writing from Geneva, Switzerland, about the "Studies in the Berlin Gesundheits-Arut," describes the method adopted for the analyzing of air, water and soil, for the detection of bacteria micrococci and bacilli. A long glass cylinder drawn to a very narrow tube at one end, and covered with a rubber shield at the other, is used. The air from a given locality is drawn through this tube by a pair of bellows. The cylinder rests horizontally; contains a layer of sterilized gelatine mixture, which is poured in hot and solidifies in cooling. When a given quantity of air having been drawn through the tube, the rubber shield is attached to one end, and the other open narrow end is closed by a plug of sterilized cotton. In the course of twenty-four hours the germs begin to show on the surface of the gelatine in the form of the well-known opacities, "vegetable moulds," which first appear in isolated spots. In a day or two the spots coalesce, the gelatine is fluidified, decomposed, and further observation rendered *nil.* But this process is easily retarded by placing the cylinders in an ice-chest. The number of the opacities in the whole cylinder gives of itself a coarse idea of the purity or impurity of the air, and the examination of them under the microscope reveals their precise character.

In the examination of water and soil, the culture substance is poured upon glass slides, where it solidifies. The gelatine is now inoculated with the water on the earth, and a number of the slides are banked up so that each is separate, and the whole bank, containing perhaps twenty slides, each of which has three inoculations, is placed in a moist chamber. In the course of twenty to thirty hours the opacities begin to present flocculi, which gradually increase in size. The "flocculi" are seen under examination by the microscope to be composed of several kinds of micrococci and bacilli, or are commingled with the common vegetable *pilze.* All that is necessary to get a variety pure is to reinoculate from the purest place another set of slides, and thus to finally arrive at the isolation of individual germs.

One of the most important conclusions reached by this means of study, was the discovery of the fact that the upper layers of the soil are always rich in bacteria and bacilli, while micrococci are present in much less degree. With reference to this interesting point, I may as well quote literally from Dr. Koch's report to the Health Office some time ago.

"Samples of soil from very filthy places, for instance, from accumulations of manure, showed an excess of micrococci, with the presence also of the vegetable fungi (schimmel pilze), but this is always only a local phenomenon. On the other hand, the upper layers of cultivated soil (horticulture and agriculture) show constantly and in great quantity the presence of bacilli. Such organisms were found in the soil of the garden of the veterinary school at Berlin just as abundantly as in the earth of a long disused burial ground, or as in samples of soil taken from fields and gardens far removed from inhabited places." Dr. Koch goes on to state that when these samples of earth are allowed to dry, the few micrococci present disappear in the culture substance, but the bacilli remain just as abundantly as before the desiccation. Hence it is concluded that the micrococci soon perish when dry, while the bacilli in the form of spores still remain alive. And this view is confirmed by the fact, as proven by experiments with disinfection by heat, that the germs of bacilli withstand a degree of heat which is fatal to the maturer forms. Dr. Koch considers it probable that these bacilli spores do not spring up in the earth where they are found, but that they are wafted thither from distant products of decomposition, or are carried over in the dust of the air. It was by means of these investigations that the author arrived, also, at the very curious fact that all micro-organisms, however abundant on the surface of the earth, gradually diminish in its depths, so that at the short distance of one metre (40 inches) the earth is almost free. Even in the middle of Berlin samples of earth at the depth of one metre were entirely free from bacteria or bacilli, and showed upon the surface of the gelatine culture substance but very few scattered colonies of the smallest micrococci.

A Valuable Book of Reference.

THE FIFTH VOLUME OF

THE SANITARY ENGINEER,

OF NEW YORK.

Includes the twenty-six weekly issues from December 1st, 1881, *to May 25th,* 1882.

A complete record of all United States Patents for fixtures and appliances used in plumbing, sewerage, gas fitting, gas manufacture, steam and hot water heating, ventilation, and electric lighting, makes it valuable to inventors and manufacturers.

The following are a few of the many articles of permanent interest:

A review of town sewering in England, with opinions on the question of small *versus* large sewers, or the combined *versus* the separate systems, by Robert Rawlinson, C.B, Chief Engineer, Inspector Local Government Board, England.

A report on the Sewerage of Concord, by Edw. S. Philbrick, C.E., instructive to town authorities generally.

Remarks by John S. Billings, Surgeon, U. S. Army, before the Academy of Medicine, New York, on sewer gas and the value of modern methods for excluding it from houses. This article throws considerable light on a question generally misunderstood.

Electric Lighting; its Fire Risks and their Remedies. Two articles by Prof. Henry Morton, President Stevens' Institute of Technology, Hoboken, New Jersey,

Illustrations, with description of the Arrangements for Heating and Ventilating the Bridgeport School House (intended to be a model building).

A continuation of Dr. J. S. Billings' Letters to a Young Architect on Ventilation and Heating, with illustrations of notable buildings.

A continuation of the "Sanitas" articles on Plumbing Practice (illustrated). Interesting to architects, builders, and plumbers.

Steam Fitting and Steam Heating, by "Thermus," a series of practical articles (illustrated), of great value to steam fitters and architects.

Illustrated Descriptions of notable jobs of Plumbing Heating, and Ventilating in Private Residences in the United States, including those of Mr. W. H. Vanderbilt and Mr. R. H. Bishop, of New York.

A series of articles on Petroleum Legislation in the United States, by E. G. Love. Ph. D.

A Report to the Greenock Board of Police on the Ventilation of the Sewers of Thirty-three Towns in England, compiled from information received from City Engineers, by Alex. J. Turnbull, C.E. Valuable to engineers and health officers.

A series of carefully prepared editorials on the Water Supply of New York, discussing the various schemes proposed for increasing it; also the measures to prevent waste. Opinions of prominent English engineers on the practice in England, and suggestions for American adoption, in connection with a controversy over the rules of the New York authorities with regard to the manner of flushing water closets. The letters and articles on the question of Valve *versus* Direct Supply to Water Closets are of great interest to manufacturers, plumbers, health officials and water works engineers.

Reports on Adulteration of Food and Drugs in the State of New York, being full abstracts of the reports of Professor Chas. F. Chandler, on Milk (fresh and condensed); Prof. G. C. Cornwell, on Butter (dairy and artificial), Cheese, Lard, Olive Oil, and Fruit Essences; by Professor A. H. Chester, on Canned Meats and Animal Foods; by Dr. E. G. Love, Ph.D., Cereals and the Products and Accessories of Flour, Special Artificial Foods for Infants and Idvalids, Baking Powders, Cream Tartars, Alum Powders and the "Alum Question;" by Professor A. S. Lattimore, on Canned Fruits and Vegetables, Vinegar Spices, etc.; W. H. Pitt, M.D., on Sugars, Glucose, etc.; J. E. Englehardt, Ph.D., on Wines, Beers, Spirits and Cordials; by J. Hoffman, Ph.D., on Crude Vegetable and Animal Drugs, Pharmaceutical Chemicals and their preparations; by Professor Caldwell, on Quinine Pills and Capsules; by W. G. Tucker, M.D., on Citrate of Magnesia and Seidlitz Powders.

These reports are on examinations made under the direction of the New York State Board of Health with a view of ascertaining the condition of the Food and Drug supply in the State, and the extent and charaeter of the adulterations practiced. They are valuable to health officials, analysts, and manufacturers.

Notes upon some Prosecutions in Great Britain under the Food and Drugs Act, by Alfred Senier, M.D., F.C.S.

Paris Street Cleaning, by James Tallmadge Van Rensselaer. An elaborate and full account of the system and the cost of its maintenance—of value to city authorities.

Washington Drainage, a carefully prepared review of the evils complained of, and the various schemes proposed for the reclamation of the Potomac Flats and the sewerage of the city.

Price, bound in cloth, $3.00. Postage 40 cents.

OUR FUTURE NATIONAL HEALTH ORGANIZATION.

No. IV.

Taking into consideration the present situation of the National Board of Health, and the character and strength of the opposition to it, as explained in our preceding papers on this subject, we come now to consider the future prospects of the board, and what is the best course to pursue.

In the first place, is it wise at the present time to contend for the existence of a National public health bureau? We think it is. Although the creation of the National Board was perhaps premature, the public and Congress not having been educated as to the utility and importance of such a branch of government, we believe that now there is sufficient interest in the matter to induce Congress to give attention to the subject, and there is a fair probability that something will be done. Second, what should be the duties of such a bureau? If the views of skilled sanitarians are to be taken, and the public are sufficiently educated, we have no doubt that the most important duties of such a bureau are indicated in the Act constituting the National Board of Health, viz., to make investigations, collect and publish information, and to give advice. It should be charged with the supervision of a National System of Vital Statistics, with chemical and biological investigations of preventable diseases, with securing, as far as possible, uniformity and efficiency in the methods of State and Municipal health administration, and the advising of all departments of the government in matters pertaining to the public health. This would include the giving of advice and the preparation of rules and regulations with regard to quarantine, whether this is to be administered by National or by local authorities. Whether it should also have executive functions in the management of quarantine appears to us to be a matter of secondary importance. This, however, is not yet the view of the public or of those members and Senators who are most active in endeavoaing to establish a Public Health organization. To them, quarantine seems to be the great and most important consideration, and the other functions of such a bureau to be either of minor importance or positively inexpedient. For example, the Chairman of the Senate Committee on Epidemics, who is the strongest advocate of a National Board, takes the position that the only ground for the existence of such a Board lies in the power of Congress to regulate commerce, and that therefore the only duties which can properly be imposed upon it relate to quarantine. If the Board cannot have quarantine functions he thinks it should not exist. While we are sure that this view is erroneous, it is necessary to take it into account, and if we can only have such an Educational Health Board as we desire, upon condition that it shall have charge of the aiding State and local Boards in their quarantine work, we certainly advise acceptance of the condition.

At the present time the Marine Hospital Service does not command the confidence of State and Municipal health authorities as does the National Board—of this we have fully satisfied ourselves; and the more urgent the Supervising Surgeon-General is to be placed in charge of a National Quarantine, the more suspicious the people are likely to become.

The third question is as to the organization of our National Health Service. Shall it be a Board as at present, or placed in the hands of one man, a Commissioner of Health? Personally we prefer the latter plan as giving more efficiency and fixing responsibility, and this is really the only valid reason for turning the matter over to the Marine Hospital Service. But we know that the general feeling is in favor of a Board which is supposed to represent the various interests of the country, and such a Board we accept. The general plan of the present Board seems to us as good as any other, but in the selection of members we do not think that physicians only should be taken. It seems to us that the Board should contain one or two members selected from the mercantile class. We also think that much more power to act should be conferred by the Board itself upon either its president or secretary than it has heretofore granted. These, however, are matters of detail; the main point is that no additional legislation seems to us necessary so far as the organization of the Board is concerned. There may be no good reason why the execution of whatever the Board may decide upon as regards quarantine should not be carried out by the Marine Hospital Service, nor why Collectors of Customs should not disburse the funds necessary for that purpose, and be paid the usual percentage for so doing; neither are we prepared to assert that such an arrangement is impracticable; we do not know, however, whether this would do away with the hostility of the Treasury Department.

On a former occasion we have expressed our preference for one-man power, and a strong man, too, yet we recognize the danger that the one man may not be sustained in Washington with the many influences to work against him, unless he yields to pressure from politicians, and consents to many things that would not be entertained by an officer such as should be at the head of our National Health Organization. We fear that the present head of the Marine Hospital Service, however sanguine he may be, would not be able to withstand this pressure, and this apprehension, we know, is shared by many whose only desire is to secure the best organization and administration obtainable.

Digitized by Google

Of one thing we are satisfied, viz.: that the business men and merchants of this country, are beginning to understand that the uniformity in quarantine regulations, which is so important to their interests, can only be secured by some National Agency; that the National Board of Health has proved itself such an agency, and that Congressmen will find it to their interest to pay attention to this subject, if they wish to retain the confidence of their constituents.

DIPHTHERIA IN PHILADELPHIA.

Diphtheria, since its modern recognition as a specific disease, has continuously appeared in the annual death reports of Philadelphia, varying, it is true, in the number of deaths attributed to it, but still always present. In the year 1861 the mortality from the disease was 502 in a total number of deaths from all causes of 14,468, or in the ratio of 34.69 deaths to each thousand of the general mortality. After this the number of deaths from diphtheria declined so that from 1866 to 1875 the disease was a comparatively unimportant factor in the death rate, causing only from 100 to 200 deaths annually in a population then of about 700,000.

In the latter year (1875), however, the mortality from diphtheria rose to 652, and in the following year (1876) to 708, the highest number reached up to the present year; the 708 deaths occurred in a general mortality of 18,892, which would give a proportion of 37.47 deaths from the specific cause to each 1,000 of the whole number of deaths. In the subsequent years up to 1882, the average yearly number of deaths from diphtheria was about 50 per cent. less.

A writer in the *Medical News* (Nov. 25, 1882) on the "Mortality Statistics of the United States," has deduced from the compendium of the tenth census the ratio of 51.33 deaths per 1,000 of the deaths reported from all causes as the death rate of diphtheria during the year 1880, in the United States. Comparing with this ratio those calculated above for Philadelphia in the two years of the greatest mortality from diphtheria (34.69 and 37.47) it appears that this city has heretofore never suffered very severely from the disease. During the present year the deaths from diphtheria in Philadelphia, up to December 2, 11 months, have been 801 in a total mortality of 18,481, or the ratio of deaths from the disease to those from all causes equals 43.34. This is still below the mortality reported from diphtheria for the whole country in 1880—a year, it may be said, not distinguished by an unusual number of deaths from the disease. However, it is possible that the calculation of the writer in the *Medical News*, comprised under the term diphtheria also the deaths reported as from croup; this would make the comparison less favorable for Philadelphia, but still would not reduce the mortality from diphtheria in the country at large below that of Philadelphia, except perhaps for this year.

The mortality from the disease now reached in the city is not the result of a sudden outbreak, but, following the experience of the past, has been attained rather gradually, as the sequence in the number of deaths during the several months from January, 1881, to November, 1882 (included), will show: 37, 24, 23, 18, 44, 21, 41, 32, 27, 51, 75, 64—84, 55, 48, 41, 66, 55, 55, 53, 95, 112, 137. These deaths have not been specially aggregated in any one section of the city, with the exception of the suburban ward of Frankford, from whence a rather greater proportion of cases of the disease were reported.

To explain why diphtheria is more fatal in Philadelphia this year than before is not easy with the limited data at hand. There has been no unusual congregation of children or others during the year by which the spread of the contagion (always present, as has been shown,) could have been facilitated. "The bicentennial celebration" took place after the mortality had begun to increase. Neither has the weather been such as to cause an unusual number of congested throats with lesions of the mucous membrane into which the poisonous germ might insert itself. It would seem that those occult conditions formerly termed vaguely "epidemic influence," and of which the presence of filth has been shown by sanitarians to be one, have increased the virulence of the diphtheritic poison. No direct evidence has been given that the city is more filthy than in past years, yet as the street cleaning and sewerage have been for some time manifestly unequal to the complete removal of impurities, it is reasonable to suppose that "nurseries" have been developed here and there for the poison in which it has gained its greater strength. Hence the germs have spread by contagion.

The Board of Health of Philadelphia, at the risk of sensational reports in regard to the severity of the disease, gave wide publicity to the increased mortality from diphtheria, that the inhabitants of the city might be placed on their guard; and had rules printed for the avoidance of the disease to be distributed widely. Especially was the danger arising from the mingling of school children with one affected with diphtheria, or coming from the sick provided against.

A careful study of the course of the disease in the past does not warrant the belief that Philadelphia is on the eve of a severe epidemic of diphtheria; it is more probable that after a moderate advance in the death rate of the disease during December and January, its mortality will show a marked decline.

This is the fourth week that we have to call attention to specimens of dangerous plumbing work in this city, done in flagrant violation of the law and of the regulations of the Board of Health.

In the work described below, John F. Ciotty was the contracting plumber, and one O'Kane the builder of the houses. The owner is stated to be Mary Dugan, but the inspector informs us that he believes Mary Dugan to be an assumed name of the owner.

The following is the report of the examination of the four houses, Nos. 166 to 172 (inclusive)

Alexander avenue, east side, between 135th and 136th streets. No. 164, on the corner of 135th street, belonging to the same lot, was locked up so securely that we failed to get in. It was in this house the Inspector stated he found the worst cases.

"In the cellar of each house the connections between lead waste pipes from the fixtures in the basement with the cast iron pipes leading to the house drain were of mortar or cement. The waste pipes from the wash tubs, from the sink and from the water closet ran separately into the cellar bottom and connected (the Inspector said) with earthenware drains. The 1-inch or 1¼ inch lead wastes entered the hubs of 2-inch iron pipes with no stronger connection than cement. Almost every joint was loosened by a slight pull with the hand. In one case (No. 166) where a large piece had been broken out of the top of the spigot hub, it was easy to see the exact structure of the connection. The lower and greater part of the space between the lead pipe and the iron hub was filled with paper and the top rounded up with mortar as shown below.

"At first the traps on the basement water closet, tub and sink were unventilated. In answer to an order from the Board of Health, the plumber had been putting vent pipes on the traps of the tub and water closet wastes (which are side by side). The water closet traps had evidently been taken out to do this, for one (that in No. 166) had been left (since the day before) with no connection between the trap and soil pipe; *i. e.*, the bottom of the trap just entered the hub of the soil pipe, leaving an annular opening, out of which the air rushed violently when the closet—a hopper—was discharged, as it was once during the examination. The air pipe from the traps in house No. 172 (and presumably to be so arranged in the others, which had not been completed) was carried out through the rear wall and up on the outside of it, ending just below a window.

"On the third floor of house No. 168, the lead vent pipe from the sink and basin traps entered a Y branch on the soil pipe by a defective connection. A piece of iron pipe was used for a ferrule, and the lower part of the space between this and the hub on the Y imperfectly caulked with lead, the upper part being filled with putty, which only was in sight. The waste pipe connection with the soil pipe was of the same sort, but a little better done. The same method was used on the floor below."

Other similar cases have been brought to our notice, and are now being investigated by our representatives; and if the facts warrant, we shall present them to the public in our future issues.

The labor required to verify these cases is such that we cannot conveniently publish more than one a week. We trust it will not require many more exposures to induce the Board of Health to take more vigorous action than they have hitherto done.

PROSECUTIONS UNDER THE FOOD AND DRUG LAW.

The action of the State Board of Health in at last beginning prosecutions under the Food and Drug Adulteration Law, passed in May, 1881, has caused quite a flutter in the grocery trade. This law took effect in September of the same year. The following eight months were consumed in making preliminary examinations into the condition of the food and drug market of this State by a number of specialists. Their reports were submitted during March, 1882, at which time we printed a supplement, in which very full abstracts from them were given. The four regular analysts of the Board were appointed at the following quarterly meeting, but did not get fairly to work until after the usual summer vacations. We understand that the Board have evidence of a number of violations of the law, and it is to be hoped that they will now act promptly.

We imagine that a good many men in this city never heard of the New York State Board of Health until the arrests were made, which we elsewhere comment on.

With a view of avoiding any needless embarrassments, we call attention to the suggestion elsewhere made as to the importance of publishing, as speedily as possible, the list of exemptions and standards that the Board are now prepared to allow. If it is to be permitted to sell a mixture of ground gypsum and cream of tartar, it will be interesting to know whether the percentage of gypsum is to be restricted to 37 or 92 per cent.

The sending out of an explanatory circular, as in the case of the illuminating oils law, it seems to us would be desirable.

Digitized by Google

The exposures of rascally plumbing that have recently been made in our columns seems to be having a good effect in other cities. Information reaches us that in Boston, San Francisco and Philadelphia the reputable plumbers are taking the lead in securing legislation providing for official supervision of plumbing, and the registration of plumbers.

This city being looked to as a model, we hope our authorities will begin to look after this matter of registration, which of late does not seem to have had the attention it deserves.

Many supposed that the steam seen escaping from the ground in John street during the past week was from breaks in the pipes of the American Steam Heating Company. Their representative, however, informs us that they had no breaks there at the time, but that the steam was caused by Croton water in contact with their steam pipes, which came from a break in the water pipes.

Judging from the report of Dr. W. H. Watkins for the month of October, presented to the Auxiliary Sanitary Association of New Orleans, that city seems to be suffering from a water famine.

"Of 727 premises inspected, but three were supplied with water from hydrants, and six were totally without water supply. Dr. Watkins explains that this means that only six were found without cisterns, but "that scarcity of water is daily becoming more apparent as evidenced by the number of persons availing themselves of the supply in the gutters furnished by the Association pumps." Taking this in connection with a subsequent statement as to "the quite universal practice of throwing refuse matters into the street gutters," and it is evident that impure water must be commonly used in the city. Dr. Watkins also reported that certain keepers of dairies were washing out their cans with filthy water, and cited one instance where such water was mixed in the dough by a baker when preparing the same for bread.

The ignorance of some professional men in matters outside their immediate line of work, though closely related thereto, is well illustrated by the following incident which came to our notice recently.

In the architect's plans for a new church on Madison Avenue in this city when first submitted to the Board of Health for approval a large brick sewer was shown running under the building, and the drainage system connected with it. This seemed remarkable, and the architect was asked about the nature of the ground. He said it was bad, and that they had to excavate 60 feet to secure a good foundation. Then it was evident that the supposed sewer was a ground water drain, put in before the land was filled—probably on a natural water course. Most of it is of loose rubble stone; but at the spot uncovered it happened to be of brick. To this it was evident the architect intended the sewage should go.

As we go to press, we learn that the Board of Health of this city have placed several cases in their attorney's hands for violation of the plumbing law.

The Board of Health, of Boston, were requested some time since to report upon the condition of the Tappan school building, among the children attending which there had been several cases of diphtheria. The Board presented their report to the Aldermen last week, in which they say "the ventilation is poor and some of the rooms badly overcrowded, the children of one room having each less than 70 cubic feet of air in poor ventilation. The vaults and urinals are very offensive, and are situated within about 14 feet of one of the cold air inlets to the building. We cannot say that the cause of these cases of diphtheria is directly attributable to the faults mentioned in the building and its appurtenances, but according to good authority they may have contributed in a degree to the cause, and are decidedly prejudicial to the health of the children. The defective drainage and other unsanitary conditions found in the houses of the children have been and are constantly being looked after by the Board of Health."

THE EDISON SYSTEM OF WIRING BUILDINGS FOR THE INCANDESCENT ELECTRIC LIGHT.

No. I.

In response to inquiries from our subscribers for descriptions of the methods of "wiring" buildings for the electric light, we begin herewith a series of articles on that subject.

FIGURE 1.—PLAN OF HOUSE CATCH-BOX.

FIGURE 2.—SECTION OF FIGURE 1 THROUGH X X.

The system of the Edison Company as employed in their first district in this city for illumination by the incandescent light from a central station has been chosen for the first number. Similar descriptions of the methods of other companies will follow.

The conductors from the central station through the streets to the houses are carried underground. They consist of copper rods of segmental cross-section, enclosed in iron tubes which are buried about 2 ft. under the pavement near the sidewalk. Each tube contains two rods or conductors—one from each pole of the dynamos—insulated from each other, and from the tube by a non-conducting bituminous substance which fills the space within the tube not occupied by the rods. The conductors are first held in position (their surfaces being at about equal distance from each other and from the tube) by disks of prepared millboard slipped over them before they are put into the tubes. These disks are placed at distances of four to six inches apart, and have holes in them through which the insulating substance in a melted state is forced, to fill the tubes. To do this more thoroughly and leave no vacant spaces, the air is pumped out of one end while the liquid is forced in at the other. These tubes are made in lengths of about 15 feet, and the conductors joined by U-shaped strips of copper (within an iron box filled with the insulating material), to allow for expansion and contraction. The tubes containing the street mains are about 2¼ inches in diameter. A line of this size on each side of

Digitized by Google

every street in the district constitute the "net work," which aggregates about fourteen miles in length. "Feeders," in tubes ranging from 2½ to 3½ inches in diameter, run to various street intersections from the central station.

From the mains, branches run to every house to be supplied. For ordinary houses these branch tubes are between ¾-inch and 1¼-inches in diameter, and end a short distance inside the wall in a "house catch-box" shown in Figs. 1 and 2. This consists of a rectangular iron frame *p* holding a wooden base *o* on which are screwed the brass castings, and an iron cover *g* fastened

FIGURE 3.

FIGURE 4.

down by the hinges *r r*. The electric tube *a* just enters one end of the box, while the conductors continue beyond its end, are bent at right angles and connected by binding screws with the nearest castings as shown. At this point the circuit may be broken, and the means for making and breaking it correspond to the stop-cock on a gas service pipe, controlling the

FIGURE 5.—PLAN OF VERTICAL MAIN CUT-OUT.

FIGURE 6.—SECTION OF VERTICAL MAIN CUT-OUT.

admission, in the one case of electricity, and in the other of gas, to the fixtures of the house. The first (or lower) casting serves to transmit the current from the conductor *b* through the jaws *c c* to a conical cup (opposite the hinges), the centre of which is directly below that of a hollow cylinder (having screw threads on the inside) which is a part of the other casting under the bar *l*, which binds to it the distributing wires. Connection between the two castings is made through lead wires in a wooden plug having a corrugated copper band on the outside, which fits into the screw threads on the inside of the cylindrical part of the casting. This plug is shown in the section (Fig. 2), and in the left hand plan. Projecting from the bottom of it is a conical brass plug *d* (in the section) which fits into the corresponding cup in the first casting. To this is soldered a number of easily fusible lead wires *e, e*, coming up through the wood, which pass under the screw head *f* and are bound by it to the brass plate *g*, which is connected by wires *h, h*, to the copper band *i*, which makes connection with the casting *k*, and thus out through the wires *m, m*, to the various lamps. The soft wires *e e* melt and break the circuit before the wires get hot enough to burn off their insulation or do other damage; the circuit would then be easily restored by the insertion of a new plug. As the plug is inserted by a slow screw motion, which might make and break the circuit several times before it was fully in place, provision is made for completing the circuit directly between the two castings by a brass plug *j*, which is removed after the permanent "cut out" plug is firmly in place.

After leaving the "house catch-box" the wires pass into the meter, which may be placed in any convenient location. The external appearance of

FIGURE 7.—PLAN OF WALL CUT-OUT.

FIGURE 8.—SECTION OF WALL CUT-OUT.

the meter is much like that of a gas meter. It consists of an iron box, the front of which can be removed for inspection, containing in the upper part two electrolytic cells (of amalgamated zinc plates in a zinc sulphate solution) through which a part of the current passes, and in the lower division a lamp to keep the liquid in the cells from freezing. The arrangement for lighting the lamp is automatic, and consists of two strips of different metal (having widely different coefficients of expansion), riveted together, fixed at one end and free at the other. A fall of the temperature inside the meter box sufficient to freeze the liquid in the cells above bends the strip enough to produce a contact between the end of the strip and a pin below which completes a circuit through the lamp until the temperature is raised enough to unbend the strip. The amount of light used is measured by the loss in weight of one zinc produced by transference to the other, which gains an equal amount. The two cells are exactly alike, except that one is short-circuited by a shunt (consisting of a corrugated strip of German silver) having four times the resistance of the similar shunt by which the other is short-circuited, so that the deposit in the first is only one-fourth as great as that in the second, and consequently requires reading only one-fourth as often. The object of the first is to furnish a check on the readings of the second, which should always be in the same proportion as that given by the first. The first is visited once a month by an inspector, who takes away the plates to be weighed, and replaces them with fresh ones, while the second is ordinarily visited only once a quarter.

The distributing wires from the house box are of No. 10 copper (0.134 inch in diameter), covered with a double thickness of braided cotton thread, which, in turn is covered with an incombustible paint, as are all the wires used, of whatever size. They are also enclosed in wooden strips or casings, as shown in Figs. 3 and 4. They are simply thin, narrow boards with grooves for one or more wires and a cover or face-strip fastened on by screws. In new buildings, when the wires are put in while the construction is in progress, they are carried under floors and in partitions. Rough wooden strips are used under floors for main lines and branches to chandeliers, but branches to side lights are in small zinc tubes behind the plaster. The double cotton covered wires are also taped before being inserted in the zinc tubes. Under tile or marble floors, or in other places, to which access is especially difficult, lead pipe is used instead of zinc tubes. In old buildings the wooden strips are fastened to the surface of the walls and ceilings, in sight, and are, accordingly, more finely finished. The number of wires from the house box depends on the number of lamps wanted and the distances to them. A single No. 10 wire will run about thirty 16-candle power lamps as ordinarily arranged in a store a hundred feet deep.

The method of running the wires is similar to that used for gas and water pipes. Vertical mains from the meter are run up through the house and branches taken off for the fixtures on each floor. The horizontal mains under each floor supply the side lights on that floor and the chandeliers in the story below. These floor mains have on them, close to the vertical mains, what are called "vertical main cut-outs" for cutting out each floor without interfering with any other. A plan and section of this cut-out is shown in Figures 5 and 6. It consists of a wooden block to be placed in a pocket in the floor or baseboard, with means similar to that in the house box, for passing both the "in" and "out" current through a lead wire, which will fuse when sufficient heat is developed by any accidental resistance in that line and the current to that floor be thus cut off. The following is the course of the current through the cut-out: from the line wire *a* through the binding screw *b* and the plate *c* beneath it to the copper lining *d* of the plug socket; thence through the corresponding copper band *e* around the plug *f* to a soft lead wire *g*, passing down through the centre of the plug and joining a copper cap *h*, on the bottom of the plug, which rests on a brass plate *i*, to which the screw *k* binds the exit wire *l*. The cut-outs on each wire are exact duplicates, the upper one being represented in the plan as containing the plug in place and the lower one, with it removed. The plug is covered (shown only in the section) by a brass cap, *m*.

In addition to the cut-out for each floor is one for every fixture, placed on the ceiling or wall at the root of the chandelier or bracket. These are covered by a cup or shell, which appears to be only an ornament. This "shell" is sometimes made to slide down or forward on the chandelier rod or wall bracket, to give access to the cut-out (to replace a plug, should one "burn out") and are held in place by set-screws. Such a wall cut-out (for a single bracket) is shown in Figs. 7 and 8. The following is an explanation of the letters: *a*, brass cap covering the circular wooden block *b*; *c*, wooden plug; *d*, entrance wire, fastened by a screw to a brass plate *e*, which is connected by solder to the copper lining *f* of the plug socket; *g*, copper band surrounding the plug, connecting by a soft lead wire *h*, with the cup *i*, resting on the brass plate *k*, to which is bound the exit wire *l*.

In the remaining portion of this article we shall consider the application of the Edison system to the Mills' Building, of this city, where, on account of the extent of the work, there are some modifications of the methods employed for ordinary buildings as described above.

STEAM FITTING AND STEAM HEATING.

BY "THERMUS."

No. XVI.—*Continued.*

DIFFERENTIAL VALVES.

Figures 27, 28 and 29 illustrate the Holly regulating valve and meter, and are here introduced to show what has been done in the endeavor to accurately measure the steam furnished by a supply company to the consumers.

What makes steam so difficult to measure is its variable pressure and the fact that condensation will go on at any pressure. If steam could

FIGURE 27.

be kept at a constant pressure and condensation arrested, it would be as easily measured as gas, and a price per cubic foot could be established for it, as then a cubic foot would have a constant weight and a constant value.

To make myself comprehensive to those who do not understand the *unit of value in steam*, I will explain that by *weight* only can steam be measured with any reliable accuracy. A pound of coal will convert from 5 to 10 pounds of water into steam, depending on how well the coal is burned. It matters little for warming purposes what the volume of the steam may be (though for power it is desirable that the volume should be small and the tension high). It is the weight evaporated which must be taken into consideration, and which will establish its commercial value or selling price. After it is steam it has a thermal value, and this latter quality, unlike most other salable commodities, is of but *one* quality, a pound of steam having very nearly the same heating properties whether the pressure is one pound per square inch and with a bulk of 1,600 cubic feet, or 50 pounds per square inch with a bulk of 440 cubic feet. But should steam be sold by the cubic foot at 50 pounds per square inch, it will have three times the thermal value a cubic foot as five pounds will have, and consequently should have three times the commercial value. Thus the prime condition necessary to measure steam by volume is to have the pressure constant.

To do this the regulating valve *A* is used in connection with the current meter *B*. The valve is a common slide valve operated by the diaphragm *C*. Steam enters from the street through the pipe *D*, say at 50 pounds pressure more or less, and passes unreduced to the valve *A*, through which it flows until it exerts a pressure in the pipe *E*, the meter *B*, and the house pipe *F*, sufficient to overcome the weights on the lever of the diaphragm, when the latter will inflate and close the valve *A* until the passage is barely sufficient to maintain the standard pressure required on the house side of the regulator.

The steam, after leaving the regulating valve, reaches the meter *B* (shown in detail in Figs. 28 and 29) at a reduced and practically constant pressure, through which it passes with a variable velocity, consequent to the requirements of the heating surface or engine.

Fig. 28 is a vertical section through meter and Fig. 29 is a horizontal section on the line *k*. The steam enters through the pipe *B*, which is square and fitted with a metal tongue, *t*, the lower and free end of which rises and falls as the quantity of steam varies. It will be noticed there are two sets of fans, *f* and *G*. The steam strikes the upper fans, *f*, causing the shaft *b* to revolve and communicate its motion to the dial at the top of the meter. The lower fans, *G*, act as a governor. They run in the lower chamber, which is filled with the condensed water, to keep a steady and uniform resistance on the upper fans, which otherwise would be likely to race and require an index with a greatly increased train of wheels.

FIGURE 30.

FIGURE 28.

FIGURE 29.

I must not be understood as conveying the idea that this meter measures volumes as a wet or dry gas meter; it does not, it simply records linear measure, as an anemometer or any other current meter, and may be made approximately correct by comparative tests from which a unit may be formulated to agree with the index.

The question has been asked, "If steam cannot be successfully weighed when entering a building, cannot an apparatus be constructed to weigh or measure the condensed water as it leaves the building?" The reply to which has been, "Yes, if we know exactly how much water was carried mechanically into the building with the steam and the steam was used for heating purposes only." But so long as this is an unknown quantity and likely to vary very much with the changes in the weather, and as nearly all buildings run pumps or engines wasting steam to atmosphere, it cannot be done this way.

The question of water carried from the mains may also be a source of uncertainty with the current-meter, but withal there are good grounds for supposing a more just conception can be formed of the quantity of steam passed to a building by the aid of this simple wheel than by any arbitrary unit for the time used, founded on the heating surface within a building or on its glass and wall surface, and the limited data at present at the command of the steam engineer when we also take into consideration defective apparatus and leaky and neglected traps; last mentioned of which have been known to make a difference as great as 25% when put in order.

The Locke automatic pressure regulator for street mains (Fig. 30, though not properly belonging to the subject) is introduced to give another instance of the use of the diaphragm, and how, though exerting a small force itself, it can be made to govern powerful engines, and in the

Digitized by Google

hands of one who knows its value its uses are manifold.

In the illustration the pipe *C* leads from the reservoir and it has a pressure too great to be admitted into the distributing pipe *D*, and as the consumption of water from the latter pipe is irregular, a reduced passage or a *set* valve is not sufficient to keep a constant pressure within it.

In this case the gate *a* of the valve *A*, is regularly and automatically moved on its seat, though it is unbalanced; the pressure in the pipe *C* being much greater than in the pipe *D*. To the head of the sliding disk *a* is attached a piston rod and piston *b* which work in the cylinder *B*. The full force of the water in the pipe *C* passes through the strainer *i* and pipe *d* to the slide valve *F* (the connection of the pipe *d* to the top of the diaphragm *E* being only for steadying). The reduced force of the water in the pipe *D* also passes through the little pipe *m* to the diaphragm *E*, the lever of which operates the slide valve *F*. When the pressure in the pipe *D* falls below what the weight on the lever of the diaphragm is set for, the latter subsides and opens the passage in the valve *F* between the pipe *d* and the pipe *f* admitting the full force of the water to the under side of the piston, forcing it upwards and drawing the gate with it when more water will be admitted to the pipe *D*. When the pressure in the pipe *D* increases, it will again inflate the diaphragm, this time opening the passage on the valve *F* between the pipe *d* and the pipe *f*, allowing the force of the water to pass to the top side of the piston and force the gate downward, reducing the supply. The pipes *j* and *k* connect each end of the cylinder with the low pressure side of the valve and act as exhaust pipes for the water after it has been used. These pipes also act the part of a governor over the velocity if the movement at the cocks in each is reduced so as to allow the water to pass out much more slowly than it would flow in through the pipe *d* and *f* and f^1, thereby always maintaining sufficient difference of pressure in the end at which the water is flowing in to force the piston to the other end, though both the exhaust pipes are open.

[TO BE CONTINUED.]

MASTER PLUMBERS' ENTERTAINMENT.

The second in the course of entertainments given by the Master Plumbers' Association of this city at Steinway Hall, took place on Tuesday evening of last week, and was a great success. The hall was well filled with an appreciative audience. A pleasing feature of the entertainment, which consisted mostly of music, was the singing of the Misses Conron, daughters of the veteran plumber, Mr. George Conron, of this city. The proceeds netted about $1,000. The next entertainment in the course will be a lecture by the Rev. William Lloyd on "The Almighty Dollar," which is put down for Jan. 9.

Examinations for granting certificates on Sanitary Science will be hereafter held quarterly, under direction of the College of Physicians of Ireland. The following subjects will be included in the papers:—1. Engineering, including hospital and house construction, sewage, drainage, ventilation, and water supply. 2. Law; the Acts relating to Public Health; duties of health officers. 3. Etiology and prevention of disease; epidemiology, contagion, infection, hereditary influence, accommodation and conveyance of the sick and the management of hospitals. 4. Chemistry; air, water, and food. 5. Meteorology and climatology; vital statistics.

A deputation of physicians and members of Health Boards in various parts of the Dominion of Canada assembled at Ottawa last week to prepare a memorial to the Government on Sanitary Legislation. They ask that a Bureau of Vital Statistics be established at Ottawa in connection with one of the Public Departments.

We have received a copy of the *Asbury Park Journal* containing instructions of the local board of health on care of privies, removal of garbage, etc., which seem to indicate that the parties interested in making this a favorite place of resort are not forgetting the importance its sanitary condition will have in the success of their efforts.

Food and Drugs.

PROSECUTIONS UNDER THE FOOD AND DRUG LAW.

The State Board of Health have commenced prosecutions under the Adulteration Law by causing the arrest of the following persons in this city for selling cream of tartar which was adulterated with ground gypsum.

P. H. Peterson, 765 Second avenue; Henry Fulle, 823 Second avenue; Martin Lahm, 922 Second avenue; Mathew Kelly, 851 Tenth avenue; F. Diedrichs, 499 West 57th street; Henry Seekamp, 982 Second avenue; S. Steiermann, 926 Second avenue; H. Goldberger, 983 Second avenue; C. Sinnigen, 1002 Second avenue; D. F. Deike, 880 Tenth avenue.

The complaints were made by Mr. A. L. Colby as inspector, and Dr. E. G. Love, as analyst for the Board.

The accused pleaded not guilty, but were held in $100 bail each, for trial at the Court of Special Sessions.

The adulteration in the above cases amounted to from 37 per cent. to 92 per cent. of terra alba or ground gypsum. In every case the accused stated that the substance had been purchased for pure cream of tartar, and he did not know that it was adulterated, which statement was doubtless true. The price paid for the samples was that of the pure article, and if in the trial it appears that the dealers paid a correspondingly high price to the wholesale dealers or manufacturers, the fraud will be placed upon the latter class, where we suspect it properly belongs.

So far as the enforcement of the law is concerned the retail dealer must be held responsible for the quality of the goods he sells, and he in turn must protect himself by obtaining proper guarantees from the wholesale dealer as to the purity of the goods he may buy. It is a part of the business of wary tradesmen to know what he is selling, and the excuse that he "thought it was pure" cannot protect him in the eye of the law. At the same time he cannot be expected to have every suspected article analyzed to ascertain its purity. For this he must rely upon the guarantee of the manufacturer.

In the cases already brought by the Board the dealers must, therefore, pay the fine if convicted, and then commence proceedings against the wholesale dealer to recover the amount. Doubtless a test case will be selected and if it goes against the dealers the accused will pay the fine without trial. In possible proceedings against the manufacturers it will hardly be necessary for the retail grocers to prove that they asked for pure cream of tartar. A mixture of ground gypsum with tartaric acid does not constitute cream of tartar, and so long as the grocer did not ask for the cheaper substitute there would seem to be no difficulty in holding the manufacturer responsible. Had the manufacturer sold it as a mixture of ground gypsum and tartaric acid, and the grocer in his turn stated to the purchaser that it was not cream of tartar, but a cheaper and inferior substitute, the question would be different.

The plea would possibly be raised that the public demanded a cheaper article, and that some substitute was necessary. This is an old dodge on the part both of wholesale and retail dealers, and yet it would be found wanting as any protection against prosecution for violation of the law. This excuse has probably been urged more in the case of spices than anything else. We are told that the public do not want pure spices; that they are too strong, etc. Of course, if the purchaser wants his mustard with 90 per cent. of flour, and his pepper with 20 per cent. of sand, well and good, that is one question, but it is quite another when we consider the right of the dealer to sell these articles with the understanding, expressed or implied, that they are pure. When a man buys butter, mustard, pepper or other substance he is warranted in supposing that he is getting the genuine article unless informed to the contrary.

As a matter of fact the consumer has become so accustomed to the use of cheap substitutes that he finds the pure articles "too strong," as in the case of pepper. He has not had occasion to learn that if he used a pure article a much smaller quantity would suffice. If the public demand a mustard containing fifty per cent. of flour, there is no objection to the manufacturer supplying the demand, provided he clearly states on his label just what the substance is. The trouble is that these inferior substitutes are sold as pure articles and at the price of the pure articles. We suspect that if the average purchaser was told that a certain sample of pepper was half cocoa-nut shells he would not buy it, and the same can be said of other articles of food.

There are a number of food products which are frequently reduced in value by the admixture of some foreign matter, and which call for the establishment of some standards by the Board of Health.

The addition of flour to mustard is clearly forbidden by the law, and any one selling such an article without stating the nature of the mixture is liable to prosecution. At the same time, if the Board see fit to limit the percentage of flour, which may be added to mustard, and we see no reason for not doing so—the sooner such a standard is fixed the better for dealers and the simpler will be made the question of prosecution.

In the case of vinegar, what is the lowest percentage of acetic acid which this article shall contain? There may be little or no adulteration with mineral acids, but the dealer can "let down" the vinegar with water until there is scarcely any semblance of vinegar left.

Is gelatin to be allowed to be sold for isinglass, even at the price of the former article?

There are other articles of a similar nature which as sold at present are violations of the law, and yet in which some standard should be established. This power to fix standards and to declare certain articles and mixtures exempt is given to the State Board of Health, and it only remains for the Board to take some action in the matter.

It is only fair to the manufacturers that a list of standards and exemptions be published at the earliest possible moment, and a special meeting of the Board should be called to take action on such recommendations as the chairman of the Sanitary Committee who has charge of this matter is prepared at this time to make.

THE ACIDS OF THE PHARMACOPŒIA.

In order to show what changes have been made in this important class the following table is appended:

	U. S. P., 1880.		U. S. P., 1870.	
	Specific Gravity.	*% Real Acid.*	*Specific Gravity.*	*% Real Acid.*
Acid Acetic	1.048	36.0	1.047	36.0
" " Dilute	1.0083	6.0	1.006	4.5
" " Glacial	1.056–58	99.0	.....	.....

" Sulphurous	1.022	3.5	1.035	6.5
" Tannic	Solid.	.....	Prep'd from Nutgalls	
" Tartaric	"	100.0	Solid.	100.0
" Valerianic	.....Dropped....		0.935	

Three acids official in the old Pharmacopœia have been dismissed, viz.: oxalic, phosphoric glacial, and valerianic; the first and last because not much used medicinally, and phosphoric glacial, because almost invariably adulterated with sodium metaphosphate.

Six acids have been introduced into this edition:

1. *Glacial Acetic Acid*, containing 99% real acetic acid, was needed for the preparation of solution of Acetate of Iron. Ordinary 36% acetic acid contains too much water, and cannot be used in this preparation.

2. *Boric Acid*, or *Boracic Acid*, is rapidly coming into use an an antiseptic; it was introduced on this account.

3. *Dilute Hydrobromic Acid* has been much used for several years in place of alkaline bromides. Several ten per cent. acids have been sold in the trade, known as "Fothergill's strength," or "Wade's Acid," etc.; but often these have contained objectionable amounts of impurities. This acid is intended to do away with these unsatisfactory acids.

4. *Oleic Acid.* The satisfactory results attending the external use of metallic and alkaloidal oleates during the past one or two years necessitated the introduction of oleic acid.

5. *Phosphoric Acid.* A concentrated "syrupy" acid is much used for the preparation of syrups containing acid phosphates, and the trade has usually been supplied with an acid containing from 60 to 65 per cent. of real acid.

Digitized by Google

But also 50 per cent. acid, used in proportional amounts, answers as well, and is better adapted for preparation of the diluted acid by the addition of water.

6. *Salicylic Acid.* This acid has sprung into notice and has been shown a most valuable medicine and antiseptic entirely within the past ten years. The amount now used medicinally, and as a preservative agent, is very large and constantly increasing.

The most important changes in strength have been made in the case of the following acids:

Acetic Dilute.....	Now	6.0%	Formerly	4.5%
Hydrochloric Dilute...	"	10.0%	"	7.8%
Nitric Dilute.....	"	10.0%	"	11.6%
Sulphuric Dilute.....	"	10.0%	"	11.8%
Sulphurous.....	"	3.5%	"	6.5%

By inspection it appears that the principal diluted mineral acids have been made uniformly 10 per cent. of real acid. As these acids are administered in small doses largely diluted, these changes of strength will not be dangerous or inconvenient, and doses need not be materially changed.

It is practically impossible to make water absorb and retain, at ordinary temperatures, 6.5 per cent. of sulphurous acid gas (SO_2), and even to prepare a solution containing only 3.5 per cent., as is now required, necessitates great care and thorough refrigeration. At 15°C. we find that 3.5 to 3.0 per cent. is about all that water will readily absorb. The present standard is certainly high enough, and it may be wise to lower it slightly in the next revision.

There are other minor points that might be mentioned in this connection, but a careful study of the descriptions and tests will best bring them to view.

Notes.

Distilled extract of witch hazel is chiefly produced in various parts of Massachusetts, Connecticut and New York.

The farmers sell to the distillers the small twigs, preferably in the fall, when the leaves are off. Some of the stills used hold a ton or more of these twigs, together with water enough to cover them. Steam heat is used in distilling, and the strong smelling distillate is the desired product. The amount distilled from a ton of twigs is from 50 to 80 gallons of first-class distillate, but more is sometimes produced of less strength. The composition of the volatile substances thus obtained has not yet been determined. In order to prevent deterioration, it is usual to add from five to ten per cent. of alcohol to the distillate, which is then sold in barrels to wholesale dealers, who put it up in smaller packages to accommodate the retail trade.

After the distillation, there remains in the retorts a dark-colored, very astringent liquid, which, as yet, has not been put to any important uses. It is reported that this has been used as a source of tannic acid; if not of value in this way it may possibly be of use for tanning leather.

The distilled extract of witch hazel should not be confounded with the fluid extract of the *Pharmacopœia*, which is made not from the twigs but from the leaves.

New Method for the Direct Determination of Chlorine in Presence of Bromine and Iodine, and of Bromine in Presence of Iodine.—Vortmann showed a short time ago that, in the presence of small quantities of free acetic acid, chlorides are decomposed neither by lead dioxide nor by manganese dioxide; on the other hand, lead dioxide decomposes bromides and iodides, and manganese dioxide only decomposes iodides, bromine or iodine separating out in the free state. Under certain conditions, of which sufficient dilution of the acetic acid is the most important, this property can be used for the quantitative determination of chlorine in the presence of bromine and iodine and of bromine in presence of iodine. The results are perfectly satisfactory when the chlorides are in excess; with small quantities of chloride in the presence of much bromide, the results are less satisfactory; the quantity of iodide has no effect on the result. —*Journal of the Society of Chemical Industry.—Chem. and Drug.*, Oct. 14, 1882.

Oil of wintergreen and oil of sweet birch are prepared by distillation in various regions in the Blue Mountains. The two oils are almost identical in composition and physical properties, and very much which is labeled as oil of wintergreen is probably oil of sweet birch.

The apparatus used is simple and inexpensive, and a day's produce, for two men, is said to be from one to two pounds, worth about two dollars per pound.

SECONDARY BATTERIES.

The so-called "storage" batteries have never offered a very encouraging field for investors, and just now the affairs of the English company, which was formed to operate the Faure patent, are such as quite to discourage those who placed money in the concern in the hope of seeing it both a scientific and a financial success.

As we have already had occasion to remark, there appears to be no good ground for claiming that the secondary battery will ever play any conspicuous part in electric lighting. Doubtless there are special cases, in which cost is of minor importance, where the battery will be found of great use; but these cases will never make the success of the enterprise. The public have yet to learn to what extent the systems of incandescent electric lighting can be considered as profitable investments, and this too, when the electric current is supplied to the lamps direct from dynamo machines. Place a secondary battery, which necessarily involves a loss of energy between the electric machine and the lamp, and the probability of dividends becomes even more remote.

When a roll of lead was "charged with electricity" in Paris and sent to Glasgow, and Professor Thomson wrote his letter of approval, the public naturally supposed that before long the "boxes of electricity" would form a most important feature in electric lighting. Unfortunately such has not proved the case.

The control of the Faure patent seems to be in the hands of one M. Philippart, who, if the reports be true, is a notorious speculator; and on this point recent events show there can be little doubt.

Something over a year ago an English company was formed for the ostensible purpose of manufacturing and selling the Faure batteries. M. Philippart has a controlling interest in this company, and the announcement is just made that a change of policy has been ordered. The English Company instead of continuing the manufacture of the accumulators is now to become a stock-jobbing concern. Licenses are to be sold to smaller companies, and a revenue made out of the pockets of unsuspecting persons instead of by the more business-like plan of making and selling the batteries.

The London *Engineer* has gone into the question with much thoroughness and makes some very plain statements which are not likely to advance M. Philippart's interests very rapidly. A recent number of the *Journal of Gas Lighting* reviews and supports the statements of the *Engineer*.

It appears that the Chairman of the Company and the Board of Directors are opposed to the change of front, but the only course left them is to submit. As to the reason for this change the *Journal* says:—"Applying the common principles of trade to the circumstances, as they have been laid before the public, it does not require powers of deep perception, or a mind warped by prejudice, to conclude that the main reason for this change is that the old work of the Company did not pay, and has consequently been abandoned for a movement which is expected at least to recoup the shareholders for some of their sunken capital." This seems to be the only natural conclusion to be drawn from the action of the company, and doubtless in the immediate future more will be heard of the Faure accumulators as a speculation than as a genuine business enterprise.

It may be well to repeat here what we have already mentioned that there is no storage of electricity in the secondary batteries as we understand the storage of gas in a gas holder. In the charging of the batteries a certain chemical change is effected in the leaden plates of which they are composed. By afterward connecting the two poles of the battery a current of electricity is obtained, and the plates assume their natural condition. According to *Engineer*, all the experiments with these batteries "have taught the same lesson—namely, that the battery is not trustworthy, save in the most experienced hands, and that even when used with great care it is liable to go to pieces and to prove worthless just when most wanted." The same journal says that there are not half-a-dozen Faure batteries in existence which could be sent out to do a couple of nights' lighting with certainty. It appears that the company referred to persistently refuse to supply charged batteries for the use of consumers, although the uncharged batteries have been offered for sale

It certainly must be acknowledged that the secondary batteries under favorable conditions can supply electric current for incandescent lamps, and on a small scale, for obtaining mechanical energy, but the cost is not known and under the circumstances can safely be stated to be out of all proportion to their value.

It is equally true that future experiment may modify existing batteries or introduce such radical changes as to bring them within the limit of profitable investment, but at present the true state of the case is presented by *Engineer* when it says, "There is not at this moment any secondary battery in existence, the success of which is so assured that the inventor would be justified in asking the public at large to invest in it."

ELECTRIC LIGHT NOTES.

The United States Electric Light Company began lighting the streets of Charleston, S. C., Dec. 5. The company now have 36 arc lights for street lighting, and 15 in the Agricultural Hall Building, and 107 incandescent lamps also in the Hall.

Engineering gives some interesting photometrical results of the Brush lamp, made at the installation of electric lighting at the Eastern Railway Station, Paris. The lamp was compared both with the standard candle and with the Carcel lamp.

WITH STANDARD CANDLE.

The very rapid growth of the telegraph, telephone and electric industries has called forth the suggestion that schools be organized for the purpose of educating young men and women as electricians. The suggestion is certainly a very good one and if thoroughly carried out would do much to improve the present stock of electricians, and supply a want long felt.

The Board of Trade of Philadelphia filed a complaint asking the courts to order the Brush Company to remove its poles. The Company put in their answer Dec. 6, in which they state that the poles are a component part of the apparatus for producing the light. They say with reference to putting their wires underground that no method of carrying the wires underground has hitherto been brought into successful use even for the telegraph and telephone wires, which employ a much weaker electric current, and are, therefore, easier to insulate. The Company gave bonds to place its wires underground when an underground system has been found to be effective, and will not hesitate to do so.

The agent of the Wamsutta Mills writes to the editor of *Cotton, Wool and Iron* with reference to the Edison lights in the mills. The plant cost about $12,000, and consists of three K dynamos, each of the capacity of 250 A lights of 16 candle power each. One light serves four looms, giving an equal amount of light to each loom. In other parts of the mill the arrangement is such that one lamp lights about the same space as two four-foot gas burners. The whole system from the word go has moved along without a hitch. The agent says it is as cheap as gas at $1 per 1,000 feet; there is no smoke or heat from it; it is safer than gas; and it does not vitiate the air we live in. The dynamos are operated by one of the machinists, requiring but a small portion of his time. The power required is by actual test, one horse power for 8.6 lights of 16 candle power each. The cost for power, taken in connection with the power to drive the mills, is very light, at the night end of the day. They are unable to detect any increase

Digitized by Google

in the consumption of coal, but the fires are probably burned a little lower. The cost of lighting our mill, which contains 51,000 spindles and 1,072 forty-inch looms, as follows, putting the power at $30 per year per horse power, is estimated as follows:

87 horse power for 300 hours at $30	$261	
375 lamps at $1 each	375	
Labor operating dynamos	90—	$726
Interest and wear and tear on plant at 8%		960
Total cost of electric light		$1,686

Meter-ites.

A Smoke Abatement Institute has been formed in England under the presidency of Mr. Ernest Hart.

The Executive Committee have decided to use gas burners of 600 candle power and upwards, placed 24 feet apart and 30 feet from the floor in the South room of the Crystal Palace, during the Electric and Gas Exhibition. The Exhibition promises to be successful.

The question of cheap gas is now creating a lively agitation in Montreal, which the gas company is seeking to meet by spreading broadcast a sheet containing a statement that gas is now being furnished to Montreal consumers as cheaply as it is to many American cities. The Montreal *Star* believes gas will be furnished to consumers at $1 per 1,000 cubic feet inside of two years.

The *Würtemburg Gewerbebiatt* fears that the coal beds of Germany will be exhausted at no very distant date. Within 20 years the production has increased from 12,300,000 tons to 59,900.000. In the same period the production of England rose from 85,400,000 to 149.000,000, of France from 8,300,000 to 19 400,000, and of North America from 15.200.000 to 70,300.000. The coal fields of Germany cover 3,600 square miles compared with the 193,000 of North America.

The discovery of coal deposits in Algiers has been noted in a communication by M. Pinard, to the Académie des Sciences. Tests made with coal from Bou-Saada show a yield of gas and illuminating value equal if not superior to the results given by the best French and English coals. The yield of coke is varied between 62 and 66 per cent. of the coal carbonized. The veins of coal are found in company with immense deposits of white sand, the product of the disintegration of great beds of grit, of the same nature and origin as that commonly found with coal measures.

THE SMOKE NUISANCE.

THE EFFORTS TO SUPPRESS IT IN CINCINNATI.

(From our Special Correspondent.)

How to be rid of the smoke nuisance has been our great social problem, and the Cincinnati *Gazette* has taken the lead in insisting upon an abatement of the nuisance and such local legislation as would render the consumption or prevention of smoke compulsory. The opinion of this journal was endorsed by the manufacturers and business men, and about eleven months ago an ordinance was passed by council requiring all who own or use furnaces of any kind to consume their smoke, leaving it to the discretion of the police court judge; to determine if in any case it is or is not practically complied with. An inspector, Wm. Olhaber, was appointed to see to the enforcement of the law and, within the time named, the nuisance has been abated not less than fifty per cent. A brief history of the public effort to accomplish this result by means of various devices, is the object of this article.

The first device introduced in Cincinnati that effected any consumption of smoke was one applied by a gentleman named Burkhardt about a quarter of a century ago. Its intention, however, was probably to economize fuel, and consisted of the injection of superheated steam into the fire box. The next in order appears to have been one known as Baum's arch, which was simply a fire bridge built from above, instead of from below, to within a short distance of the fire bed, thus forcing the gases to pass immediately over the incandescent coal. The next was Walker's double furnace, which consisted of two fire boxes, built side by side with a fire bridge between, so arranged as to cut off the draft from either one and force it to pass through the other, to reach the flue. A bed of incandescent coal having been made in one, the draught was shut off from the other in which fresh fuel was being burned, and the vapors passed over this fire bed before reaching the flue, thus burning the carbon. The next device used was Murphy's Automatic Stoker, by which the furnace was fed with fuel, without opening the doors, in small quantities and often. The next was Sinton's series of arches, which forced the gases and vapors to take a long journey through the heated furnace. And the next was the Hutchinson device at first and still in use on the furnace of the Cincinnati *Gazette*. It consists of the injection of jets of superheated steam from each side at a certain angle over the coal bed. So soon as the compulsory ordinance was passed, the inventive genius of the city was stimulated into unusual exertion and devices multiplied to an extent quite beyond the limit of this article to describe or even mention. Those, however, which have met with more or less success are about 15 in number, of which six are systems of arches, six steam jets, and three stokers. All the devices range themselves under one or the other of these classes, being different modifications of the principles supposed to be involved in each. The brains of by far the greater number of inventors, however, have been exercised upon steam jet devices. While many of these various devices have proved meritorious, it is proper to mention at this point that experience has proven a first-class, careful human stoker to be the best device of any. There are so many of these, however, so imperfectly constructed and so unreliable, that mechanical contrivances are a necessity. The construction of arches and automatic stokers really rest their claims to greatest efficiency upon the assumption that the chief requirement for the burning of smoke is a continuous degree of heat in the furnace, sufficiently high to combust the gases, and that with this ensured, the draught of air sufficient to carry off the vapor supplies all the oxygen that is necessary to the process of combusting the carbon. The inventors of steam jets reverse that assumption and hold that the uncombusted carbon escapes in the form of smoke, because there is a want of oxygen to complete the process and that the heat usually generated in a furnace is sufficient, although by introducing oxygen and burning all the combustible elements of the coal the heat is increased and fuel economized. The object of the arches built from above is to bring the smoke, as stated, close to the incandescent coal, and thus to apply the necessary degree of heat claimed to be necessary in the stoker system. There has been a general disposition of manufacturers and others to comply with the law and consume their smoke, but they have regarded the various devices with suspicion. Fear, at the outset, was expressed that the steam jets would, by concentrating a high degree of heat beneath the boilers, burn them quickly out. With many imperfect devices of this kind, perhaps, this fear was not entirely groundless, but the writer is informed by Mr. Inspector Olhaber that there has been no instance of such a result come to his knowledge, and that this is not a necessary consequence seems to be demonstrated by a two years' continuous use of the Hutchinson device in the *Gazette* furnace, as well as that of the Bellevue incline plane, where it has been used for nearly the same length of time. The arches, while proving apparently efficient in consuming the smoke, have not as yet, it would seem, been constructed in a manner and of such material as to render them durable. The intense heat and the expansion and contraction breaks them all down. The automatic stokers prove to be more effective in large than small furnaces, but they are free from one of the greatest difficulties experienced in the use of, but not incident to, the other devices—that is the inattention of firemen, who put in too much coal, leave the furnace doors open too long, or fail to turn on the jets. It is not improbable that by some combination of the automatic stokers and steam jets this difficulty may be overcome at the same time that the most perfect combustion is accomplished by effecting all three conditions that appear necessary to complete success; to wit: systematic feeding, a continuous high temperature and a sufficient supply of oxygen. As matters now stand there is a fair outlook for a satisfactory abatement of the smoke nuisance, so far as furnaces are concerned, before winter is over. When all the smoke has ceased to pour from the thousand flues of the manufactories it will then be determined what proportion they furnish of the dense canopy of smoke that still hangs over the city, and how much of it during the winter is the product of private residences, which the compulsory ordinance does not affect. It is not improbable that where soft coal is exclusively used for fuel in a city, its smoke must always constitute a nuisance, and already, as if in recognition of this fact, there is being brought to the front as a solution of the smoke problem, the exclusive employment of crude coal gas for purposes of heating and cooking. It seems, in fact, to be in the near future.

THE DRONES OF THE PLUMBERS' HIVE.

[From our Special Correspondent.]

CHICAGO, *Dec.* 7, 1882.

The Master Plumbers' Association of Chicago held their quarterly meeting at their handsomely furnished quarters, No. 185 S. Clark street, this evening. Although the thermometer stood six below zero, with the rush of work that statement involves, there was a goodly attendance, the officers present being Secretary Alex W. Murray, Sergeant-at-arms James H. Roche, and Committeeman, Wm. Sims. Aldermen Sanders and Ryan were understood to be frozen up at home, hence a promised tilt on the merits of the Durham system was postponed. After informal discussion, the evening's paper, the joint product of J. J. Wade and William Sims, commanded close attention. It treated of the "Drones of the Plumbers' Hive" and singled out, for special reprobation recreant apprentices. They were an expensive nuisance to plumbers the country over. They started out to learn the trade, but quit when just beginning to earn their salt and so deprived the one who educated them of services that honestly belonged to him. The renegade boy should be "boy"-cotted. There were apprentices who were faithful and true to their employers, and it was recommended that some special honor be bestowed upon them; for instance, that a badge of merit be distributed among the worthy young ornaments of the trade, and that it be held as a sort of passport to the best employment and wages. By such token they would be known as excelling in the line of business they followed, and the device would be an encouragement to first-class work. There should be some kind of an apprentice system that should be binding both on the employer and employé. This was a matter that interested every master plumber in the United States, and especially concerned parents who desired that their boys should learn a trade of this kind. At present it was too generally a shame and a scandal to the plumbing fraternity that intelligent boys could not be induced to learn the plumbing business.

The Association's next meeting will be the Thursday before Christmas.

ARTESIAN WELL AND SPRING WATER.

MADISON, WIS., *Nov.* 15, 1882.

To the Editor of THE SANITARY ENGINEER:

Thinking that it may possibly be of interest to you, I enclose you a copy of the analysis of the water from the first artesian well of the group to be bored to obtain the water supply for this city.

The well, which is 5 in. in diameter, is sunk through 215 ft. of drift, and 535 ft. of Potsdam sand rock to the granite.

The water raises to a point about 4 ft. 6 in. above 4th Lake or Lake Mendota, and about 18 in. above the natural surface of the ground about the well.

According to the R. R. levels, its flood line is 275 ft. above Lake Michigan, and 853 feet above the sea level.

The well has been pumped from at the rate of 480,000 gallons per day without reaching the limit of its capacity. Two other wells, 8 in. in diameter, are now being drilled.

Would be pleased to give you any further information you might desire. Yours truly,

CHESTER B. DAVIS, *M. Am. Soc. C. E.*
Chief Eng. Madison Water Works.

"Prof. W. W. Daniells chief chemist at the State university, has just completed an analysis of the water from the city artesian well, which is to supply the Madison water works. The analysis is as follows, the composition being expressed in grains per United States gallon—a comparative statement of the composition of the Bethesda spring at Waukeska, being also given:

	Madison City Well.	Waukesha Bethesda Spring.

"It will be seen that our city water is better in several respects than the Bethesda, but generally does not vary greatly from it.

"The relative hardness of the city artesian well water and the water of the lakes, is as follows: Lake water, 10.2; city well water, 7.3. It will therefore be seen that

Digitized by Google

the lake water is forty per cent. harder than the city well water. Experiments were made regarding the effect of the well water on metal pipe: After standing thirty days in contact with a clean piece of lead, there was no indication of lead in the water; galvanized iron pipe under precisely similar conditions gave a trace of zinc in the solution. From this it will be seen that, unlike the water in many cities, ours does not effect lead pipe and therefore no harmful result can happen from the use of that metal; on the other hand, galvanized iron might produce slightly deleterious effects.

"The city can heartily congratulate itself in having such pure, soft, and in every way admirable water, as is to be distributed by the water-works system; it is as good for drinking as Bethesda mineral water and thoroughly adapted for all domestic purposes."

[If Madison has succeeded in obtaining a free supply of pure, soft and palatable water from its new well it is to be congratulated, as the depth from which the water comes will exclude the probability of its ever becoming a carrier and distributer of the poisons of zymotic disease. The test of its action on lead is satisfactory; but we conceive that thirty grains of inorganic solids per U. S. gallon are more than would be generally considered desirable in a city supply. We must, however, judge of such matters by comparison, and if Madison in this instance is replacing a water which contains more of these substances by one which contains less there is so much gained. The resemblance of the water to that of the Bethesda mineral springs rather unsuits it for domestic purposes—its lime and magnesia salts contra-indicating the term *soft* as applied to it. The analysis by Prof. Daniells is purely inorganic, and does not indicate the presence or absence of organic matter by any of the processes used by sanitary analysts. Presumably the water is free from organic mater by virtue of its filtration through the beds of drift and sand-rock, but it would be as well to verify the presumption.—ED. SAN ENG.]

EXEMPTION OF PLUMBERS FROM ZYMOTIC DISEASES.

TORONTO, *Dec.* 2, 1882.

To the Editor of THE SANITARY ENGINEER:

I have read with considerable interest the articles in your journal of Nov. 2 and Nov. 23 on the above subject, and, like our friend Mr. Hughes, consider it a subject well worthy of investigation, and one that ought to awaken a particular interest with the plumbers themselves.

I regret, however, that I cannot fully endorse the views laid down in these communications. My experience for over 20 years has been that plumbers are particularly liable to contagion from the so-called zymotic diseases, whether or not it is caused by inhalation of disease germs during the performance of their work, or from other causes.

I am not in a position to show, but certainly the death rate of plumbers from typhoid and diphtheria is very high. We have had in our city five deaths from the above diseases (in our ranks) within as many months; only this week two brothers, both employed in the plumbing business, succumbed to this fearful malady.

The writer has been particularly unfortunate in this respect, having been a victim to its ravages on two different occasions—once in New York, and at that time (1870) there were no less than 43 members of the League incapacitated from their work, and the majority of the cases were of the infectious or zymotic class. It must be borne in mind that there were then no plumbing laws in existence, and New York had not the best appliances in the world.

If Dr. Burrall will compare statistics of the above date with the present he will probably find a marked improvement in the general health of plumbers in New York, which, no doubt, is greatly due to the steady advance of sanitary reform.

The remarks of Mr. Hughes or his physician, that the system can take in large doses of poison without producing serious effect, are probably true in the way in which he puts them, but the better way is to avoid the small dose and it will not be necessary to take the larger. The fact that plumbers can and do perform some very unpleasant work without any apparent discomfort to themselves, simply because it is their daily duty to do such, is no argument in favor of their exemption; for some time the disease will catch on, and with fatal results, too.

W. J. BURROUGHES.

FRENCH PLUMBING.

TORONTO, *Dec.* 2, 1882.

To the Editor of THE SANITARY ENGINEER:

I notice in your issue of Nov. 23 an inquiry from Mr. Brown for a work on Plumbing Practice in France, and your remarks thereon.

In reply to Mr. Brown's query, would say that I was engaged in the plumbing business in Paris and in Strasburgh for nearly two years, and in all that time I never met a Frenchman who could do a decent job, much less write a work for others' guidance. A stranger looking upon their gilded palaces, grand saloons, picturesque parks, and their élite society, has no idea of the methods employed in disposing of their garbage and night soil, which is usually done in early morn before many people are likely to be eye witnesses. W. J. B.

TRAPS AND AIR INLETS ON DRAINS.

(A SHODDY JOB.)

CLINTON, IOWA, *Nov.* 20, 1882.

To the Editor of THE SANITARY ENGINEER:

Last summer I was called on to plan a system of sewerage for one of our best dwellings, it never having been connected with the public sewer. We arranged the plan with a grease trap outside the house, and into it discharged only the waste from the kitchen sinks, the grease trap or reservoir discharging into the house sewer leading to the street sewer. This house sewer I extended past the grease trap, along side of house, outside, some 25 feet to receive the waste from two bath tubs, one water closet, and two basins. I planned a ventilating trap in this house sewer near where it passed the grease trap; the air vent of this trap was to have been on the house side so as to ventilate the house sewer and soil pipe, it extending above roof. Some time after the job was done the inmates complained of sewer gas in the house. We personally attended to the grease trap and believed it correct, and we left the pipelayer to complete the balance of house sewer by putting in the trap and laying balance of pipe. When the presence of gas was detected we carefully examined what we could see of the works in the house and found them correct, and found that the seal of the trap to the Jennings' water-closet was forced, it being very little more than ¼ inch. We decided to open up and examine the ventilating trap, and here we found the trouble. The pipelayer not finding a ventilating trap put in a running trap, and so set it by placing it out of level that there was no water seal. I measured and found it lacked nearly two inches of sealing. We had it torn out and a ventilating trap put in and saw that its seal was good. Since this there has been no complaint. This proves to me that your method of trapping house sewers is correct. No ventilating the main public sewers through the house pipes for me.

Very truly yours for sanitary improvement.

W. W. SANBORN.

[From your description we infer that there was some defect inside the house which was only made apparent when the gas from the sewer had ready entrance to the house drains. If your house pipes and joints were tight, traps protected against syphonage and soil pipes open above the roof, you would not have had the smell you complain of. Suppose you try the peppermint test inside the house?]

VACUUM VALVES.

MACON, GA., *Nov.* 18, 1882.

To the Editor of THE SANITARY ENGINEER:

My enquiry of the 13th October, to which you now very kindly reply, was prompted by the fact that in a new building fitted with a copper boiler of the best make, supplied with the safe and vacuum valve of your illustration, the boiler suffered a total collapse when the water company suddenly turned off the water a few days before the date of my letter. The water company promptly replaced the boiler with a new one, because they neglected to give notice of their intention to turn off the water; but I now desire to learn whether or not such accidents are preventable. I always use the open end relief pipe where there is a tank to carry it above, but when you have city water at 45 lbs. pressure what do you do? Yours truly, B.

[It would seem that your experience justifies our opinion that it is not always safe to rely on safety and vacuum valves on range boilers. Under the conditions named by you, viz., that you have a public water service with an average pressure of 45 lbs. to the square inch, we should advise you to take this supply to a tank, controlling it by a ball cock. Then take your supply to the boiler from this tank, returning the hot water pipe above and over the tank as a relief pipe. You will see this illustrated and fully explained in Sanitas Articles, vol. iv, page 251. You can then use copper boilers with safety.

The only other plan is to use galvanized iron boilers. This is cheaper, but not so desirable, although generally done. How your water will be effected by contact with galvanized iron you can ascertain by trial.]

EXHAUST STEAM FOR HEATING WATER.

SPRINGFIELD, *Dec.* 5, 1882.

To the Editor of THE SANITARY ENGINEER:

We have an abundance of exhaust steam in our hotel from two elevator engines, passing through a 3-inch pipe to the roof. What is the simplest way to utilize it for warming the water which is distributed throughout the house for culinary purposes and for the ash basins? Now we use live steam from the boiler and pass it through a box coil of 1-inch brass pipe, the coil being within a tank four feet diameter by six feet long. We have been told that if we force the exhaust steam through the one-inch coil it will make too much back pressure on the engines; even assuming it (the steam) has heat enough in it to warm the water properly. An early answer through your paper will oblige

Yours respectfully, W. J.

[There is nearly all the heat in the exhaust steam there was in the live steam as it entered the engine, but the temperature will be lower. Still it is sufficiently high to make the water almost boiling, and it certainly will make it hot enough to scald when drawn at the faucet; unless the water has to travel in the pipes an unusual length.

The usual way to utilize the exhaust steam in New York buildings is to have a tank of the size required and pass the exhaust pipe, full size, two to six times through it in the form of a flat coil. The pipe is generally brass, with brass bends, and supported on bars set across the tank. When exhaust steam is used in a box coil the way you require it, make as large a connection as the *header* in the coil will admit of, between the exhaust pipe and the coil, but leave the exhaust pipe in other respects the same as it is now, except to place a back pressure valve at some convenient place in the exhaust pipe above the branch to the tank. With the assistance of the back pressure valve you can force just the steam you require into the coil, allowing the remainder to escape to the roof. In this case you will not be compelled to force all the exhaust steam through the coil.]

A GOOD IDEA.

NEW HAVEN, CONN., *Nov.* 26, 1882.

To the Editor of THE SANITARY ENGINEER:

I take the liberty to address this letter to you, knowing as I do, that your valuable paper is the recognized authority on sanitary matters, etc., above all the plumbing papers published this side of the water; also, that you will be pleased to hear at all times of anything occurring in the interests of good plumbing, and for the reasons above named I pen these lines.

For the past year it has often occurred to me what a benefit it would be to the journeymen plumbers of this city if they should band together and form an association for mutual improvement of its members, in studying the higher branches of their chosen profession, and after some little work, and with the help of a few plumbers I succeeded in having a gathering of most all the craft, some two weeks since, and after appointing a chairman (your respectful scribe having been chosen), and in response to a query, I gave my prospectus of what I thought would be an ideal association for the plumbers of this city, my plan being as follows: First, elect officers, levy a tax on members, payments to be made weekly for a month's time, and at an early date as possible, rent an apartment, and furnish it with standard sanitary works, papers, etc., have cuts of good and bad plumbing open to inspection, and at stated times in each month have debates on matters pertaining to the business. Also, at different periods, have a professor of Yale lecture on ventilation, etc. Well, after some little opposition from some of those present, who wanted a *union* and meet only when trade protection was needed, we formed an association to meet once a week. We elected officers and have some money in the treasury, and as I have been authorized to frame by-laws, I would consider it a favor if you would send me a copy of the by-laws of the Plumbers' Association of New York City.

R. C. ENSIVE,
27 Edward st., New Haven, Conn.

[We believe our correspondent entertains the correct idea of the proper sphere of such an organization as the journeymen plumbers of New Haven should have, and this movement is very creditable to their intelligence.]

Savannah, Georgia, was left without water for six or eight hours, on November 25. The connection which had been made between the old and new force mains blew out. The city is supplied by pumping into a stand pipe, and there is, consequently, no reserve in such a contingency. Fortunately, accidents of this kind are rare in towns which take their supply directly from the pumps. At Indianapolis, which is supplied by direct pumping, an accident to the pumps occurred a few weeks ago, followed by the breaking of the main supply pipe, and the city was without water for the greater part of a day, before the breaks could be repaired. By extraordinary good luck, no fires occurred during the suspension of the supply.

NEW YORK PLUMBING SPECIFICATIONS.

The following is the text of the new edition of plumbing specifications just issued by the Board of Health of this city. The changes from the previous edition are denoted by italics; most of them, as will be seen by comparison with the old (found on page 264 of Vol. V. of THE SANITARY ENGINEER), are slight verbal alterations not affecting the spirit of the regulations. The part relating to earthenware drain is, for the first time, embodied in the specifications, though the use of tile drain has been for several months permitted, subject to the regulations (found on page 65, Vol. VI. of THE SANITARY ENGINEER) which have been furnished on a separate sheet.

SPECIFICATIONS FOR THE PLUMBING AND DRAINAGE

of....house...on the...side of....street ....feet... .. of.....street.....owner..... address.....architect..... address....plumber... address.

Pursuant to the provisions of Chapter 450, Laws of 1881, the accompanying plan for the plumbing and drainage of each of the above-mentioned houses, and the following description thereof, is hereby submitted for the approval of the Board of Health, the undersigned hereby agreeing to cause the work to be done and the material to be furnished in accordance therewith, with such modifications as may be required by the Board of Health.

I.—GENERAL DIRECTIONS.

The plumber will furnish all materials and perform all labor requisite and necessary for putting up and completing all the plumbing work in a good and thoroughly workmanlike manner, according to the drawings and these specifications.

Where the specifications vary or conflict with the drawings, the plumber is to be governed by the specifications.

The plumber will send notice to the Board of Health when the work will begin.

All materials will be of good quality and free from defects.

The arrangement of soil and waste pipes will be as direct as possible, and, wherever practicable, the drain, soil, and waste pipes, and the traps will be left so that they may at all times be readily examined and repaired. Where they are necessarily placed *in partitions or recesses in walls*, they will be covered with face boards which will be fastened with screws, so as to be readily removed.

The plumber will also, except as herein otherwise provided:

II.—WATER CONNECTION.

Obtain and pay for all necessary permits, and comply with all corporation laws relating to *the subject matter of these specifications.*

Excavate for and insert tap in street main, if necessary.

Connect tap and house supply at point indicated on the plans by....lead pipe to weigh....per foot, to be laid.... feet below curb level.

Place a stop-cock at. ..to shut off the water when necessary.

Grade each line of supply pipe, so that it can be completely emptied at its lowest point.

III.—HOUSE SEWER—OF IRON.*

For each house make a separate connection to sewer in street, by....inch cast iron pipe....*inch thick*, run at a uniform grade to a point just *outside* of the cellar wall.

HOUSE SEWER—EARTHENWARE.

[NOTE.—*The laying of earthenware drain pipe for house sewers, in made or filled ground, is prohibited by the Rules established by the Board of Health. But where the soil consists of a natural bed of loam, sand or rock, it is permitted to be laid from the front wall to the street sewer, if laid in strict compliance with the following directions.*]

The.....will make the necessary excavations for the house sewer from the front wall to the street sewer, making a smooth bottom for each pipe, free from all projections of rock, and with the soil well rammed to prevent settling of the pipe. And the....will make a separate connection for each house with the street sewer by an earthenware pipe.....inches in diameter, hard and salt glazed, and cylindrical, and... of an inch thick; extending the same to within... feet of the front wall. Every section will be bedded in cement at the hub and along its entire length. The ends of the pipe will be wetted before applying the cement, and the space between each hub and the small end of the next section will be completely and uniformly filled with the best quality of hydraulic cement, care being taken to prevent any cement being forced into the drain to become an obstruction. No tempered up cement will be used. A straight edge will be used inside the pipe, and the different sections laid in perfect line on the bottom and sides.

COVERING HOUSE SEWER.

Notice will be sent to the Health Department when the house sewer is ready for inspection; and it will be covered only after it has been examined and pronounced satisfactory by an Inspector from the Board of Health. In filling the trench no stones will be placed in contact with the pipe, and the earth will be thoroughly packed in without moving the pipe in the slightest degree, or starting any of the joints.

* The substance of Section III. in the previous form of specifications is here divided into Sections III. and IV. and the note and paragraphs in relation to earthenware drain pipe added.

IV.—HOUSE DRAIN.

The plumber will make a proper connection with the house sewer, and set a ...inch cast-iron running, *or half S trap* just inside of the front wall, with a hand-hole for cleaning, having a cover properly fitted and joined with ....cement; the trap to be provided with a fresh air inlet on the house side thereof, of....inch cast-iron pipe, extending to....

Continue the house drain of cast iron,....inches in diameter, and .. *inch thick*, along the cellar wall *or ceiling* from trap, or in a trench cut at a uniform grade [walled up on the sides and provided with movable covers. *Previous specifications*] and having a hydraulic concrete base of four inches in thickness, on which the pipe is to rest, to the point shown on the plan, giving it an even fall to the trap of *not less than*....inch, *nor more than*... *inch to the foot.* Make necessary changes in direction by curved pipes, and all connections by Y-branch pipes and one-eighth bends. from the points shown on the plan, branch pipes to be connected with the drain pipe to receive the soil and waste pipes, the rain water leader and the connections from the area, cellar, and yard cesspools.

V.—UPRIGHT SOIL, WASTE, AND DRAIN PIPES.

For each water closet or line of water closets provide and set....inch cast iron soil pipe...., connecting with the house drain by a Y-branch and extending two feet or more above the highest part of the roof or coping. If near a light-shaft,....feet above the roof. The soil pipe to have....inch branches to receive the traps of the water closets on each story.

Provide and set, with proper connections for each basin, bath, sink, urinal, wash tray, and tub, or tier of same,.... inch cast iron waste pipe...., connected by a Y-branch ....with the house drain, and terminating above the roof in the same manner as the soil pipe. Connect each of the set fixtures with the waste pipe by a short length of.... inch lead pipe, with....inch trap.

Make all connections by Y-branches.

The....will provide .. leader *outside* the house, of galvanized sheet iron ...inches in diameter, to connect with the house drain by a cast iron trap .. inches diameter, *to be set and connected by the plumber;* or the....will provide leader *inside* the house, of cast iron ...inches in diameter, caulked with lead, in same manner as the soil pipe, to be trapped at the base, if it opens near a ventilating shaft *or window.*

Underline all set fixtures....with sheet lead of.... pounds per foot, with edges turned up at least ...inches, in a secure manner, to prevent overflow. Provide for each safe a....pipe, discharging either into an open sink, or upon the cellar floor, or outside the house as the architect may direct. *These waste pipes will not connect with the safe waste pipes from water closets or other fixtures, but may discharge into the same sink. In no case will a safe waste pipe be connected directly with the house drain, or with any pipe which discharges into the house drain.*

The waste pipe from the refrigerator will be....pipe, so arranged as to discharge into the most convenient open sink. In no case will it be connected directly with the soil or waste pipe, or the drain or sewer, or discharge upon the ground.

VI.—TRAPS AND TRAP VENTILATION.

Trap every water closet, urinal, sink, basin, wash tray, bath, and every tub or set of tubs effectively in the manner shown on the plan; the traps to be as near the fixtures as practicable.

Set for all water closets within the house... inch cast iron vent pipe, connected *by a branch pipe not less than two inches in diameter*, with the crown of each trap and extended above the roof in the same manner as the soil pipe, or connected with the soil pipe above the highest fixture.

Set for traps of all other fixtures .. inch cast iron vent pipe, connected by a branch pipe .. *inches in diameter*, with the crown of each trap, extending above the highest fixture, and there connected with the waste pipe, or extended above the roof separately, as the architect may direct. If the latter, the diameter will be enlarged to four inches from just below the roof upward.

NOTE.—It is not required that every trap shall have a separate air pipe; several may have branches into one vent, provided that each branch be as large as the waste it serves. It is imperative that every trap shall be so ventilated as to prevent syphoning and to ensure a free circulation of air through every foot of pipe.

Grade all air pipes so as to discharge water collected by condensation.

VII.—IRON PIPES, THICKNESS, TESTS

All iron pipes will be sound, free from holes and other defects, of a uniform thickness of not less than one-eighth of an inch for a diameter of two, three, or four inches, or five thirty-seconds of an inch for a diameter of five or six inches. Before they are connected each pipe will be thoroughly coated inside and outside with coal tar pitch applied hot, or with some equivalent substance satisfactory to the Board of Health. They will be firmly secured in position by....

Caulk all joints in all iron pipe with picked oakum and molten lead, and make the joints impermeable to gases, *by bedding the lead with hammer and caulking iron. No putty or cement joints will be permitted.*

Before any of the iron pipes are covered, stop all the openings, fill the pipes with water, and, if required, allow to stand twenty-four hours for inspection. If preferred by the Inspector from the Board of Health, the peppermint test will be substituted.

If any leak is discovered in a joint, make it tight or replace the defective pipe.

VIII.—LEAD PIPES.

Make all connections of lead with iron pipes by brass or copper sleeves or ferrules of the same size as the lead pipe, set in the hub of the branch of the iron pipe and caulked in with lead; the lead pipe to be attached to the ferrule by a proper solder; wiped joint when practicable. *No putty or cement joints will be permitted.*

Make all connections of lead pipes by wiped joints.

Secure all lead pipes firmly in place with hard metal tacks and screws.

IX.—WATER CLOSET CISTERNS.

The....will put up, on the roof, or over each water closet, or group of water closets, a ...cistern....x....x ....; and the plumber will connect the same with the supply pipes and arrange for the proper flushing of the water closets, leaving the whole in complete working order. In no case will a water closet be flushed directly from the Croton supply pipes; and the water from cisterns which supply water closets directly will be used for no other purpose.

Discharge the overflow pipe from each water closet cistern into an open sink, or into the bowl of the water closet, as the architect may direct. In no case will it discharge into the soil or waste pipe or into the drain or sewer.

X.—HOUSE SUPPLY TANK.

Provide a tank for drinking water, ...to be lined with tinned and planished copper, or constructed of....iron (under no circumstances to be lined with lead); and make all necessary connections with supply and house pipes. In no case will it be directly connected with a water closet; but the water closet tanks may be supplied from it.

The overflow pipe from the *house* supply tank will be *discharged upon the roof, or* carried independently to the cellar, with a deep trap, and empty into an open sink or open space.

If the pressure of the Croton is found to be insufficient to supply any fixture or any water closet tank, provide and set up a....pump, with all necessary connections.

XI.—NUMBER, LOCATION, AND DESCRIPTION OF FIXTURES, ETC.

Supply and set up in complete working order the following fixtures of the pattern and kind hereinafter described; the exit pipes to wash basins, bath tubs, wash trays, sinks, *safes*, and refrigerator wastes to be provided with strong metallic strainers:

	Basement.	1st Floor.	2d Floor.	3d Floor.	4th Floor.	5th Floor.	6th Floor.	7th Floor.	8th Floor.

CALIFORNIA PLUMBING LAW.

The following is the text of the bill to regulate plumbing in the cities of California, which is to be brought before the State Legislature:

AN ACT ENTITLED AN ACT TO GRANT TO BOARDS OF HEALTH, IN CITIES AND COUNTIES, THE POWER TO REGULATE THE PLUMBING AND DRAINAGE OF BUILDINGS.

SEC. 1. On or before the first day of August, eighteen hundred and eighty-three, every master or journeyman plumber carrying on his trade, shall, under such rules and regulations as the board of health of such city, or city and county, shall prescribe, register his name, and address at the health office of such city, or city and county; and, after the said date, it shall not be lawful for any person to carry on the trade of plumbing in any city, or city and county, unless his name and address be registered as above provided.

SEC. 2. A list of the registered plumbers shall be published in the yearly report of the health office.

SEC. 3. The drainage and plumbing of all buildings, both public and private, hereafter erected in any city, or city and county, shall be executed in accordance with plans previously approved, in writing, by the board of health of said city, or city and county; suitable drawings and description of the said drainage and plumbing shall, in each case be submitted and placed on file in the health office. The said board of health are also authorized to receive and place on file drawings and descriptions of the drainage and plumbing of buildings erected prior to the passage of this act.

SEC. 4. The boards of supervisors or other city or county officials, whose duty it is to make apportionments for the board of health of such city and county or city,

Digitized by Google

shall make the necessary apportionment, and shall insert the same in the yearly tax levy, to provide for carrying out the provisions of this act.

SEC. 5. Any court of record in said city or city and county, or any judge or justice thereof, shall have power at any time after the service of notice of the violation of any of the provisions of this act, and upon the affidavit of the health officer or a member of the board of health of such city or city and county, to restrain by injunction order the further violation named in this act, or of any work upon or about the building or premises upon which the said violation exists, and no undertaking shall be required as a condition to the granting or issuing of such injunction or by reason thereof.

SEC. 6. Any person violating any of the provisions of this act shall be deemed guilty of a misdemeanor.

SEC. 7. This act shall take effect immediately.

SEWAGE PUMPING ENGINES.

The accompanying illustration, for which we are indebted to the courtesy of the *American Machinist*, represents one of a pair of pumping engines used for pumping sewage at Pullman, Ill. The sewage of Pullman is utilized by distribution on a sewage farm some three miles distant from the pumping station. We have already described the sewerage system (in our issue of August 10, 1882), and will now only remind our readers that these engines, which are each of a capacity of 2,500,000 gallons in 24 hours, pump the sewage from a well into a 20-inch cast iron main, by which it is taken to a screening tank at the farm, and distributed through earthenware pipes to the land. The engines are of the direct acting, tandem compound condensing type, having piston pumps with phosphor bronze cylinders, fitted with valves especially designed for passing everything usually found in sewage.

The steam cylinders are fitted with the "isochronal" or self-regulating valve gear, which controls the speed under any variation in pressure or load, as in the case of the reservoir becoming exhausted, or the bursting of the main sewage pipes. The action of this valve gear is so satisfactory, says the *Machinist*, that it relieves the engineer of a large part of his duty, his presence, we are told, being required only in stopping and starting, and in attending to the lubrication. The cylinders are steam jacketed, covered with non-conducting material, and enclosed with a neat black walnut lagging.

The main steam pistons are arrested at the termination of the stroke by a positive steam cushion, which stops them without shock or jar. They are started in their stroke with an easy, gradual movement, this last named action being brought about by the operation of the cataract cylinder. (The small cylinder shown near the right of the upper sectional view). This cylinder is filled with oil, the flow of which from one end to the other of the cylinder is regulated by a graduated opening, connecting the two ends of the cylinder. The resistance offered by the oil to the piston of the cataract cylinder regulates to any desired extent the velocity with which the steam valves can be opened.

The condenser and air pumps are of the usual type, and are operated directly from their respective engine. The diameter and stroke of engine and pump are as follows: Diameter of high pressure cylinder, 14⅞ inches; diameter of low pressure cylinder, 25 inches; diameter of pump cylinder, 22 inches; stroke of all pistons, four feet. It will be seen that the ratio between the high and low pressure cylinders is about three to one. The steam pressure carried is 60 pounds. The engine is built by the Cope & Maxwell Manufacturing Co., Hamilton, Ohio.

SEWAGE PUMPING ENGINE FOR THE CITY OF PULLMAN, ILL.

The San Francisco, California, *Chronicle* suggests the construction of reservoirs on hills near the city to which the sea water might be pumped by wind-mills, and then used for flushing the sewers. There is very little rain from April to November, and the city water supply is not plentiful enough to permit of its use for flushing, nor is it enough for ordinary cleansing of the sewers, which consequently become filthy and offensive in the summer.

REPORT OF NATIONAL BOARD OF HEALTH.

The fourth annual report of the National Board of Health for the year ending June 30, 1882, is a lengthy and interesting document, which can hardly be summarized, and from which we can only give a few extracts. The greater part of the information given with regard to special scientific investigations under the directions of the Board has already been published and noticed in this journal. The following points, however, are new:

Prof. Mallett "has ascertained that the results of the so-called 'combustion process' of Frankland may be improved, and cleared of some at least of the inherent errors of the process as hitherto conducted, by evaporating the water in a partial vacuum, and the necessary details of apparatus suitable for the purpose have been worked out. It has been found that the suggested use of magnesia as the material for the expulsion of ammonia during the evaporation of the water is attended with loss of the nitrogen of certain classes of organic substances; while it appears that hypophosphorous acid, proposed as the means of reducing nitrates and nitrites, may be so employed with probably insignificant injury to the organic matter present." The results reported in the final memoir of Drs. Wood and Formad "seem to prove that diphtheria is a septic sore throat, dependent upon micrococci, which may be developed in an active state from the inert organisms always present in the mouth, or which may find entrance from without; that in scarlet fever, measles, and other affections, similar organisms exist in the blood in malignant cases, and may cause death after the original disease has spent itself, the patient dying of a secondary septicæmia; that so far as the observers can make out there is no difference between this

Digitized by Google

micrococcus and *M. septicus* of Cohn; that an important aid to prognosis is afforded by a study of the blood; whenever the peculiar vacuoles we find in the white blood corpuscles are present death is almost inevitable, and so long as in the advanced stages of the exanthemata these vacuoles are absent the situation is hopeful." Upon this the Board remarked "That it only remains to ascertain the conditions under which 'the inert organisms always present in the mouth' or the same organisms introduced from without are developed into the 'active state,' and we shall, in all probability, have it in our power to apply absolutely preventive measures against a domestic scourge, which is far more destructive in the long run than either cholera or yellow fever."

We must confess just here that we do not share in the confidence which the Board seem to have as to the probabilities in this case. The recommendations of the Chairman of the Standing Committee of the Board on Registration and Vital Statistics. Dr. J. S. Billings, "that the United States should undertake to obtain reports of vital statistics from State registering authorities by paying a part of the expense of collecting them, the total expense being estimated at $25,000 per annum is approved," and the Board "considers it very desirable that Congress should, by special act, authorize the aiding in the collection of vital statistics in the manner indicated in the report.

A very large part of the report of the Board is taken up with the discussion of quarantine, including much historical matter, with regard to the development of quarantine systems in the United States. The conclusion of the Board is "that it is neither necessary nor desirable to clothe the central authority with quarantine powers in order to obtain a reasonable security against the invasion of foreign epidemics; that the argument so often triumphantly insisted upon, that it is only by means of a national quarantine that uniformity as to the regulations can be secured, is, in point of fact, specious and deceptive; and that the public health may be as efficiently protected under the system of coöperation with State and municipal boards of health inaugurated by this Board in conformity with the provisions of the act of June 2, 1879, as under any national system of quarantine which supersedes or interferes with State authority. Such a substitution of Federal for State authority seems undesirable for the following reasons:

"1. It is doubtful whether the exercise of the authority to regulate quarantine would not be in conflict with a decision of the Supreme Court in the case of Gibbons *vs.* Ogden.

"2. If it be admitted that the power exists, its exercise would be impolitic in view of the universal and strenuous opposition of the commercial emporiums of the country, especially on the seaboard.

"3. Any such assumption and exercise of power by the general government would involve the necessity of absolutely uniform regulations for all the ports of the United States, since the Constitution requires that no preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another.' Now, such a uniformity, as to details, of sanitary regulations is not practicable nor desirable for posts so differently situated as to climatic influences and as to proximity to foreign centres of infection as are the various ports of an extended seacoast.

"4. Such a system would almost certainly lead to the establishment of an enormously extensive bureau, with no better results in respect to the protection of the public health than will be realized under the system of coöperation with State and municipal boards of health when the latter system shall have been fully carried out by the establishment of a few more refuge stations, which can be effected at a very moderate outlay for construction and equipment and trifling cost for annual maintenance."

With regard to this conclusion, we will only say that while it may be politic for the Board to adopt this States' rights ground at the present time, we believe that the United States Government has the right as a nation on the ground of self-preservation, setting aside all technicalities with regard to commerce, to prescribe quarantine regulations for the whole country. The report closes with a defence of the Board against some of the most prominent charges which have been made against it. It is shown that under the constituting act it not only had the right, but it was its plain duty to make investigations into the causes and means of prevention of all contagious and infectious diseases, and that complaints that it has transcended its powers by dealing with anything but cholera and yellow fever are unfounded. In reply to the charge of extravagance, a table of the expenditures of the Board from the day of its creation to June 30, 1882, is given as follows:

Statement of the expenditures of the National Board of Health from April 1, 1879, to June 30, 1882:

On what account.	From organization to June 30, 1879.	Year ending June 30, 1880.	Year ending June 30, 1881.	Year ending June 30, 1882.
Floating Quarantine on Mississippi River.	.....	$10,238.11	$38,040.18	$17,796.42
Ship Island Station...	.....	18,988.89	34,203.13	12,743.62
Sapelo Station.....	.....	6,669.41	10,479.31	9,949.92
Elizabeth River, Va..	.....	3,812.16	3,246.54	1,259.78
Aid to Pensacola, Fla.	.....	3,006.28	4,444.86	.....
Aid to Pascogoula, Miss.....	.....	3,791.19	97.58	.....
Aid to Hancock Co., Miss.....	.....	.....	619.35	.....
Aid to Harrison Co., Miss.....	.....	.....	766.90	.....
Aid to State Board of Health of Louisiana.	.....	11,384.68	1,901.90	.....
Aid to State Board of Health of Texas....	.....	115.00	275.00	.....
Aid to Charleston, S. C.....	.....	38.60	7,585.32	112.80
Havana Commission..	$925.69	11,336.97	662.30	.....
Pay and Expenses of Inspectors at Havana and other places.	.....	31,459.39	11,204.92	3,011.70
Special Scientific Investigations.....	.....	14,495.59	10,192.83	8,715.31
Pay and Expenses of Members of the Nat. Board of Health....	4,044.25	12,736.27	8,845.87	5,069.68
Printing of Bulletin of National Board of Health blanks, etc..	669.94	6,882.73	9,984.62	9,992.38
Pay of Secretary, Disbursing Ag't, Clerks, Messengers, etc.....	1,678.10	18,258.02	18,656 56	17,802.19
Rent, Light and Fuel.	.....	1,009,28	1,564.34	1,457.59
Telegrams.....	29.21	1,678.34	322.53	238.79
Furniture, Stationery, etc., for Nat. Board of Health office.....	620.89	2,316.76	2,685.27	1,157.64
Miscellaneous Expenses of the National Board of Health....	1,081 03	4,577.83	1,157.48	798.69
Postage.....	92.25	702.26	260.60	580.22
Report on yellow fever Epidemic of 1878....	.....	1,800.00	.....	.....
Hudson Co., N. J., Investigation.....	.....	1,000.00	.....	.....
Purchase of Tents, Furniture, etc., for Stations	.....	9,297.41	485.45	.....
Aid to State Board of Health of Tenn....	.....	36,292.44	.....	.....
Aid to State Board of Health of Illinois...	.....	1,323.32	.....	.....
Aid to State Board of Health of Miss.....	.....	7,026.64	.....	.....
Aid to State Board of Health of Arkansas.	.....	6,399.76	.....	.....
Aid to Board of Health of Mobile, Ala.....	.....	2,195.46	.....	.....
Aid to Board of Health of Meridian, Miss...	.....	218.30	.....	.....
Aid to District of Columbia.....	.....	7,710.00	.....	4,656.06
Immigrant Inspection Service.....	.....	.....	.....	3,168.15
Totals.....	$9,146.41	$266,762.16	$167,681.95	*$98,523.07

* This sum is subject to increase to meet obligations prior to August 6, 1882, to which date the appropriations for the last fiscal year were extended. Estimated amount required $35,000.

NOTE.—Total appropriation for National Board of Health..... $700,000 00
Total expenditures as per statement..... 542,113 59

Balance unexpended June 30, 1882..... $157,886 41

The report concludes as follows:

"Having shown that the charges preferred against the Board, on the grounds of alleged extravagance and usurpation of authority not conferred upon it by law, are not sustained by the record, but, that on the contrary, the expenditures have been on a scale of extraordinary economy in comparison with the magnitude of the useful work accomplished, and that this work of every kind fell clearly and unmistakably within the limits of its discretion, the National Board considers it its duty again to recommend the granting to Congress of such an appropriation, at the ensuing session of Congress, as will put it in its power to execute the law which defines its powers and prescribes its duties, to the end of conserving the public health and of preventing the introduction of contagious or infectious diseases into the maritime ports of the country and their transmission along the trunk lines of railway into the interior States.

The following estimates for the year ending June 30, 1884, are therefore respectfully submitted:

For aid to State and Local Boards of Health.

By the maintenance of a refuge station at Ship Island, Miss.....	$18,000
By the maintenance of a refuge station at Sapelo Sound. Georgia.....	15,000
By the maintenance of a hospital barge at Hampton Roads, Virginia	2,500
By the maintenance of the inspection service on the Mississippi River.....	25,000
By the maintenance of the immigrant inspection service.....	$30,000
By the maintenance of inspections at foreign ports .	8,000
For miscellaneous investigations under the constituting act, March 3, 1879.....	10,000
For pay and expenses of the members of the Board..	7,000
For compiling and printing the Bulletin and for miscellaneous printing.....	15,000
For pay of Secretary, notwithstanding the provisions of sections 1,763—64 and 65—Revised Statutes, of which sum $600 shall be immediately available.....	1,800
For pay of Disbursing agent, clerks, messengers and laborers.....	13,500
For rent, light and fuel, telegrams and postage... .	2,200
For stationery and furniture.....	1,500
For incidental expenses.....	500
Total.....	$150,000
For aid to local quarantine stations and for aid to local and State boards of health, to be used in case of epidemic	$100,000

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Notes and Abstracts.

For the week ending Dec. 2, of a total urban population of 6,438,025, there died 2,641. Corresponding to an annual death rate of 21.3 per 1,000, a decided increase over the preceding week, in which it was 20.3 and on the average for the month of November, which was 20.4.

The lowest death rates for the week have been in the river cities, 16.6, and among the whites in Southern cities, 15.1. The increase in mortality is most marked in the North Atlantic and Eastern cities—and is due to diseases of the lungs.

Of the whole number of deaths 35.7 per cent. of the deaths were under five years of age. The relative mortality of young children was especially great in Albany, Brooklyn, and Hudson Co., N. J. Small-pox caused deaths in Philadelphia, Chicago, Pittsburgh and Minneapolis.

BOSTON, MASS.—C. E. Davis, Jr., Clerk, reports 52 cases of diphtheria, 30 of scarlet fever, and 12 of typhoid fever.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr Franklin reports five admissions, five discharges, three deaths, and 1,443 remaining under treatment.

PITTSBURGH, PA.—Dr. Snively reports four cases of small-pox, as reported during the week.

LOUISVILLE, KY.—Dr. Montgomery reports two cases of small-pox taken to hospital during the week; there are no cases in the city.

DETROIT, MICH.—Dr. O. W. Wight reports 31 cases of scarlet fever, and 55 of diphtheria.

HOLLISTON, MASS.—Dr. Hiram Sake reports the appearance of diphtheria.

SANDWICH, ILL.—Dr. Ballou reports the continuance of measles.

ROCK ISLAND, ILL.—G. G. Craig, Commissioner of Health, reports three deaths for the week ending Dec. 2. One from consumption, one from apoplexy, and one from brain disease.

PROVIDENCE, R. I.—Dr. E. M. Snow reports that during the week only 31 cases of typhoid fever were noted and of these only 10 began in that period. To date there have been 462 cases recorded with 65 deaths. The progress of the epidemic is shown by the following statement:

Week ending	*Mild.*	*Average.*	*Severe.*	*Total Cases.*	*Total Deaths.*
Nov. 4th	3	34	14	51	1
" 11th	46	69	48	163	10
" 18th	34	39	41	114	28
" 25th	22	53	28	103	14
Dec. 2d	10	13	8	31	12
Totals.	115	208	139	462	65

It is probable that all the cases which occurred have not been reported, as some were so slight or so modified as to be wanting in many characteristics of typhoid fever. It is certain that the disease is diminishing in prevalence and severity.

BALTIMORE, MD.—The number of deaths reported for the week ending Dec. 2, was 207, of which 77 were under five years of age and 40 were people of color. Taking the population as calculated from the United States census, which would be about 350,000, this would

Digitized by Google

correspond to an annual death rate of 29.3 per 1,000. The Registrar reports the death rates as: whole population, 26.31; white 24.88; colored 34.67. The number of deaths from diphtheria during the week was 24; of small-pox, 25; consumption, 32; 14 from croup, 12 from pneumonia. The prevalence of zymotic diseases in Baltimore for the last month shows a very unsatisfactory condition of the public health. We regret to say that the Registrar, after consultation with the Health Officer, has formally refused to furnish a weekly report of deaths for THE SANITARY ENGINEER unless the editor would accept his estimate for the population and not change it, which as a matter of course is impossible.

MICHIGAN.—Dr. Baker's report for the week ending November 25, based on the observations of 48 medical men, in different parts of the State, shows the following diseases in the order of greatest area of prevalence: intermittent fever, rheumatism, bronchitis, neuralgia, consumption, influenza and tonsillitis. Influenza and diphtheria increased in their area during the week.

BALTIMORE, MD.—Dr. Jas. A. Stewart, Inspector, transmits report of his work at the port of Baltimore during the month of November. One thousand two hundred and thirty-four immigrants were inspected, of whom only 13 required vaccination, the others having been satisfactorily protected by the ship surgeons during the passage.

NEW YORK QUARANTINE.—During the week ending November 24, Dr. Hanor examined 6,405 immigrants, 87 of whom were vaccinated by him at the station. One case of small-pox was taken from the steamer "*Plato*," from Rio Janeiro, where the disease is prevailing. The crew of this vessel, 35 in number, were among those vaccinated.

ALLEGHENY, PA.—Dr J. H. Wright, city physician, sends report for the month of November. There were 119 deaths, 34 being under five years of age. Typhoid fever is prevalent, and diphtheria increasing. There had been no cases of small-pox. During the month 18 deaths were caused by typhoid, 10 by pneumonia, three by diphtheria, one by whooping cough and 19 by consumption.

TORONTO, CANADA.—Consul W. C. Howells reports the sanitary condition of the city as exceptionally good, since, during the week ending Dec. 2, there were 50 births, 54 marriages and only 15 deaths.

ONTARIO, CANADA.—The Health Bulletin of the province, for the week ending Nov. 25, shows the following diseases in the order of prevalence: neuralgia, bronchitis, influenza, consumption, anæmia, mumps and diphtheria.

VALPARAISO, CHILE.—Vice-Consul August Möller, Jr., reports 40 deaths from small-pox during the month of October.

WESTERRO, SANTA CATHARINA, BRAZIL.—M. W. Comsett, Consular Agent, reports, Oct. 2, the subsidence of the small-pox epidemic by the exhaustion of material susceptible to its influence. Since January there have been 141 deaths from small-pox in a total mortality of 345.

RIO JANEIRO, BRAZIL.—Consul Jas. H. Murray sends reports for the three weeks ending respectively Oct. 14, 21, and 28. Small-pox is increasing rapidly, and has been declared epidemic by the health authorities. During these three weeks there were 136 deaths from this disease, 29 during the first, 50 during the second, and 67 during the third.

CITY OF MEXICO.—Consul General David H. Strother reports, for the two weeks ending respectively Oct. 15 and 22: The total deaths were during the former 196, during the latter 171. The items are similar in both weeks. During the first, diarrhœa and dysentery caused 43 deaths, pneumonia and bronchitis 30, consumption 14. The city is free from zymotic diseases.

ENGLAND.—Vice-Consul-General Mitchell transmits the report of the Registrar-General for the week ending Nov. 18. The average mortality rate in the 28 great towns was 22.6 per mille, Birkenhead giving the lowest rate, 13.9; and Sunderland the highest, 30.7. The rate in London was 21.1. The 30 deaths from diphtheria included 21 in London. Small-pox caused four deaths in London and five in Newcastle-on-Tyne. In London there occurred also 78 deaths from measles, 68 from scarlet fever, 20 from whooping cough, two from typhus and 30 from typhoid fever.

IRELAND.—Consul A. B. Wood, Consul Belfast, transmits the Registrar-General's return for the week ending Nov. 18. The average rate in 16 large towns was 25.8. No deaths from measles, scarlet fever or small-pox occurred in Dublin. Two deaths from typhus are reported, one in Dublin and one in Waterford.

SCOTLAND.—The return of the Registrar-General for the quarter ending Sept. 30, shows 16,886 deaths, giving a ratio of 17.8 per 1.000. In the principal towns the ratio was 20.8; in the large towns, 19.8; in the small towns, 17.8; in the insular rural districts, 14.0; and in the mainland rural section, 13.7. Of the eight principal towns, Paisley had the highest ratio, 26.2; and Aberdeen the lowest, 17.5. In these eight towns there were 6,332 deaths, of which only one was caused by small-pox; diarrhœa caused 483, dysentery 10, typhoid fever 98, typhus 23, whooping cough 215, measles 115, scarlet fever 138, diphtheria 80, erysipelas 29 and consumption 744. About 32 per cent. of the inhabitants of Scotland reside in these eight towns, and experience has shown that the causes of death which are most frequent in them during a given period are likewise those which are most rife in the country at large.

SCOTLAND.—The return for the week ending Nov. 18 is given in abstract in our statistical table. The lowest mortality was recorded in Leith, 19.7; the highest in Paisley, 37.6. Of the 26 deaths from whooping cough, 19 were registered in Glasgow.

PARIS, FRANCE.—For the week ending Nov. 23, Dr. Bertillon reports 1,071 deaths, an increase of 69 over the preceding week, and corresponding to an annual mortality of 24.8 per 1,000. Of these deaths, 256 were of children under five years. Typhoid fever is diminishing, 79 deaths from this cause being reported in place of 120 the preceding week. There were 34 deaths from diphtheria, ten from small-pox, 11 from measles, five from whooping cough.

ST. PETERSBURGH, RUSSIA.—Consul Edgar Stanton reports, for the week ending November 4, 18 deaths from small-pox and 63 cases under treatment in hospitals. During the week ending Nov. 11 there were 25 deaths from this disease and 57 cases in the hospitals.

RHEIMS, FRANCE.—Consul John L. Frisbie, for the week ending Nov. 12, reports three deaths from measles in a total mortality of 48. With the exception of measles the city is free from zymotic diseases.

STOCKHOLM, SWEDEN.—Consul Nere A. Elfwing reports 67 deaths during the week ending Nov. 11. Scarlet fever caused four deaths, typhoid five, diphtheria one, consumption 16. No deaths are recorded from measles, small-pox, croup, or whooping cough.

BERLIN, PRUSSIA.—Consul General Brewer reports the prevalence, during the month of October, of typhoid fever, diphtheria and scarlet fever.

COPENHAGEN, DENMARK.—Consul Henry B. Rysen reports 89 deaths during the week ending Nov. 7, 39 being under five years. Of these two were caused by scarlet fever, one by diphtheria and one by croup. Physicians are required to report their *cases* of contagious and epidemic diseases. During the week there were 16 of measles, 28 of scarlet fever, five of diphtheria, three of croup, ten of typhoid fever, 71 of diarrhœa, 165 of bronchitis and 127 of tonsillitis.

ST. PAUL DE LANDA, AFRICA.—Consul Duverge reports, for the month of September, 30 cases of bilious or green fever with seven deaths, 28 cases of dysentery with six deaths, and 178 cases of small-pox, with 95 deaths. The last mentioned disease broke out early in the month and is spreading rapidly. Compulsory vaccination has been instituted and every effort is being made to check the progress of the epidemic.

MECCA.—The presence of the cholera among the pilgrims at Mecca, which was announced last week in communications from Constantinople and Jeddah, is reported, under date Nov. 9, by Consul W. A. Stevens, Smyrna, Turkey, who states that quarantine has been established on all routes leading from Mecca, as in 1881.

SMYRNA, TURKEY.—Consul Stevens also reports an outbreak of small-pox in Smyrna. The disease began about six weeks anterior to the date of his report, and has spread with such rapidity that new cases to the number of 300 daily are being reported. "Many have died of the loathsome disease."

BOMBAY, INDIA.—Consul B. F. Farnham reports that cholera is dying out in the presidency. In the city there was only one death from the disease during the week ending Sept. 26, and none during that ending Oct. 3. Remittent fever is prevalent, having caused 72 deaths in a total of 457 during the one week and 92 in a total of 446 during the other. Annual rates 27.23 and 27.10 respectively.

MADRAS, INDIA.—During the week ending Oct. 27 there were 284 deaths within the municipality, giving a ratio per 1,000 of 34.8. There were 66 deaths from fever, 41 from diarrhœa and dysentery, two from small-pox and two from measles. No deaths from cholera.

SINGAPORE, INDIA.—Consul A. G. Studer reports, for the month of September, 364 deaths in a population of 139,000. Remittent fever is prevailing extensively, but reported as of a mild type, yet 82 of the deaths were caused by it. Diarrhœa caused 50 deaths, dropsy 32, consumption 48, and small-pox one death. Scarlet fever, croup, diphtheria, whooping cough, and typhoid are absent from the record.

FOOCHOW, CHINA.—J. P. Cowles, Jr., Vice-Consul, Oct. 20, reports the European community free from sickness, although their hongs or houses are surrounded by the abodes of the living, and shallow graves of dead natives, while several thousands of boat populative are on the river above the settlement. The population of the city is reported as 500,000. The streets are narrow and filthy. In the centre of each, just beneath the flag stones, is a narrow drain for all sewage except night soil, which is carried at all hours in open buckets to the country and stored in tanks till required. Malarial diseases, anæmia and dyspepsia are prevalent. Among the natives, vaccination makes slow progress among them, and small-pox prevails every winter. Chicken-pox, measles, mumps, whooping cough, erysipelas, cancer, leprosy, and syphilis, are rife among them. Typhoid and typhus are epidemic, but cholera has not appeared since 1877, when it visited most of the other parts of China and Japan.

SWATOW, CHINA.—For the week ending October 7, Consular-Agent C. C. Wiliams reports eight cases of cholera among the natives, and six deaths from the disease. He notes the prevalence of malarial diseases, eye inflammations, leprosy, and elephantiasis.

COLOMBO, CEYLON.—The sanitary report for the month of October show the occurrence of 110 cases of small-pox, 17 of which were fatal. No other disease is prevailing.

SOURABAYA, JAVA.—Consular Agent Austen's cholera report for the twenty days ending Oct. 10, shows nine remaining sick from previous report, 274 taken sick, 53 recoveries, 224 deaths, and six remaining under treatment.

The Louisville *Medical News*, of November 25, contains a note by Dr. L. P. Yandell in which he says. "Malaria is *the chief source* of *acute* skin disease. Scrofula is *the chief source* of *chronic* skin disease. The more inveterate cases of skin disease are often due to the coëxistence of these two things. The specific exanthems, of course, are not included here, but I contend that their progress and termination are often largely influenced by the presence of malaria or struma. *I do not claim* that malaria and struma are the *sole* causes of the dermatoses. Indeed, *many* of the dermatoses may exist *independently* of *malaria* or *struma*, and most frequently some exciting cause is necessary to develop the cutaneous eruption. Among the exciting causes are irritants, injuries, insufficient or improper ingesta, vicissitudes of temperature, alcohol, dentition, menstruation, parturition, lactation, etc. The proofs of the truth of my views are, in the first place, that the diseases of the skin are cured more certainly and more quickly by the antimalarial remedies on the one hand, and by the antistrumous on the other, than can be done by any other line of therapeutics; and in the second place, that careful and painstaking investigation will, in the majority of dermatoses, make apparent the existence of the malaria or the struma, as the case may be."

[Precisely what Dr. Yandell means by scrofula we do not know, but presume he uses the term as a synonym for chronic skin disease.

It is also uncertain as to what he would include in the word malaria, but if it is to be confined to the cause of intermittent fever, we think that quite as much skin disease will be found in Boston, where there is no malaria, as in the Mississippi swamps, where there is plenty of it.]

Tables showing the number of new patients at seven New York City Dispensaries, for the week ending Dec. 2, 1882, with some of the principal acute diseases:

NAME OF DISPENSARY AND REPORTER.	Character of Disease.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.	Total.

Total.....	2231	340	1104	1187	20	121	45	463	13

There are some discrepancies in the totals of these two tables, depending on discrepancies in the original returns, which it has been impossible to correct. They show that during the week 2,375 new cases were reported, of which 1,066 were of acute diseases, being a decrease from the preceding week. Thursday being a holiday, very few cases were treated on that day, and there was no corresponding increase on the following day—which accounts for the diminution. The proportion of malarial fever cases has increased, contrary to what might have been expected. Whooping cough has diminished, and the acute lung diseases have increased. Six cases of diphtheria, one of measles, one of scarlet fever, two of typhoid fever, and seven of tonsillitis, are reported.

The recent Imperial decree relating to the precautions to be taken against fire in the Vienna theatres enacts that all theatres built from this date are to be completely detached. The stage is to be divided from the auditorium by a wall not less than 20 inches high and 18 inches thick above the roof, so that in case of fire the stage may be isolated from the rest of the house. The stage must be of sufficient height for the curtain to be raised without being rolled. No one is to be allowed to live in the theatre, and the stage carpenter's shops, the stage appliances and the refreshment bars are to be outside the theatre, this latter regulation to be applied to theatres already in existence. All the dresses worn by the actors and actresses are to be dipped in a preparation which makes them more or less fireproof, and no explosive matter is under any pretence to be left in the theatre. Very strict provisions are made with regard to the seating of the theatre, so that there may be plenty of room for easy exit, and the prefect of police is to have the power of deciding how many firemen shall be allotted to each theatre.

Construction Notes.

We shall always be glad to receive items of interest for this column.

WASHINGTON, D. C.—The following bids were opened at the office of Bvt. Maj. Gen. M. C. Meigs, at 12 M., Dec. 2, 1882, for the building materials specified for the fireproof building for the Pension Office:

Brick, common—Washington Brick Machine Co., $7.93 per thousand; Childs & Son & Jacob Childs, $7.23; W. H. West & Bro., $8.35.

Brick, pressed—Washington Brick Machine Co., $10.93 per thousand; Alex. Russell & Barnes, Russel & Co., $23; Childs & Son and Jacob Childs, $10.63.

Bricks, moulded—Washington Brick Machine Co., $9 per hundred; Alex, Russell & Barnes, Russel & Co., $50 per thousand; Jno. E. Herrell, $50 per thousand; do., $100; do., $170; do., $250.

Cement—S. P. Brown, round top, 43c. per cwt.; do., Rosendale, 48c.

J. G. & J. M. Waters, round top, $1 bbl. of 300 lbs.; Jas. M. McGill, 45c. per cwt., Rosendale; 75c. Portland; 85c. Eng. Portland; Lehigh Cement Co., 44c. per cwt., barrels; do., 47c., bags; J. M. Wheatly, 29c.

Lime—W. Cammack and G. W. Dickson, 41c, per cwt.; Richard McCoy, 34c. per cwt.; C. P. Maloney, $1.50 per bbl.; do. (1), 48c. per cwt.; do. (2), 44c. per cwt.; do. (3), 40c. per cwt.; Marshall & James, $1.25 per 300 lbs.; Jas. S. Walker, 40c. per cwt.; Jas. Wheatley, 37½c. per cwt.; R. C. Hewitt, 160 bbl., 45c. per cwt.; S. P. Brown, $1.24 per bbl.; do., 62c. per cwt.; do., 55c. per cwt.; do., 62c. per cwt.; M. E. Grady, 48c. per cwt.

Terra Cotta—L. I. Terra Cotta Works, $24,250; do., additional work, $3,600; A. Hall, Terra Cotta, $19.800; Alex. Russell, and Barnes, Russell & Co., $23,000; Perth Amboy Terra Cotta Co., $22,400.

Coloring Matter—James H. McGill, brick red, $1 per c.; brown, $1.75 do.; mixed, $1.50 do.; metal red, $1.75 do.

Awards have been made thus far as follows:

Wilson & Son, laying rubble stone masonry, $1.49 per cubic yard.

J. M. Wheatly, Cement, 29c. per 100 lbs.

Richard McCoy, Riverton, Va., Lime, $1.02 per bbl., of 300 lbs.

Barnes, Russell & Co., Baltimore, Md., Molded Brick, at $50 per 1,000.

Same firm, Pressed Brick, at $23 per 1,000.

J. H. McGill, Coloring Matter for mortars, at $1 to $1.75 per 100 lbs.

Robert M. Miller, Sand, at 97½c. per cubic yard.

Boston Terra Cotta Co. The terra cotta as per detailed drawings and specifications, $16,038. For additional proposed terra cotta work as per schedule and proposition with bid, $15,442

For Spandrils, also additional, $900.

MOBILE, ALA.—The bids for dredging Pensacola Bar were opened Dec. 1. Geo. C. Forbes & Co. bid 95 cents per cubic yard; P. F. Nouvet, 83⅓; S. N. Kimball, 79 1/10.—*Picayune.*

NEWPORT, R. I.—A plan has been submitted to the New Asylum Committee by James Fludder, architect, for four new buildings for the City Asylum. The total cost, including plumbing and steam fitting, is estimated at $49,000, of which $11,000 is for the lot on which the buildings will stand.

WASHINGTON, D. C.—The contract for erecting fire escapes at the Government Insane Asylum and Government Printing Office have been awarded to Mr. W. S. Chew and C. A. Schneider, both of Washington, D. C., by the Commissioners appointed by Congress, consisting of Gen. Meigs and Architects Clark and Hill.

Mr. Chew's contract calls for the erection of four stand pipes at the Printing office and five at the Insane Asylum. Each to have connected at bottom with underground water pipes and at or near the surface for connecting two street fire engines. Outlets for hose to be placed at each story and on the roof.

Mr. Schneider's contract is for exterior iron staircase opening from domitory at the asylum and three in the courtyard of the printing office. The necessary underground pipes to stand pipes will be included in Mr. Chew's contract. Estimated cost of this work will be about $5,300 under the contracts.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

Pure Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.

DECASTRO & DONNER REFINING CO.

117 WALL STREET,
NEW YORK.

Reliable Food Products.

Great progress has been made, within a few years, in manufacturing food products, and the standard of quality has been raised to a point far beyond that which formerly obtained. We claim that this has, to a considerable extent, been due to our efforts. As the Largest Manufacturers and Dealers in the world in this line, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.,

Importers, Manufacturers, and Dealers in all varieties of Food Products; New York, London, and Bordeaux.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so-called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

263,448. SEWER INDUCT AND ITS COVER. JOHN F. WITHEY, Lynn, Mass. Filed June 14, 1882. (No model.) Issued Aug. 29, 1882.

Brief.—The screws in the ears of the flanged cover operate against an annular bevel on the pipe, holding it in place.

Claim.—1. The sewer induct or pipe provided with the annular bevel, in combination with the cap arranged on the said pipe and provided with the screws to operate against such bevel, as set forth.

2. The cap having the two concentric flanges and the ears and screws, arranged with it as described, in combination with the pipe, having the chambered enlargement, and the annular bevel, to operate with such flanges and screws, as explained.

3. The cap having the two concentric flanges and the ears and screws, arranged with it as explained, in combination with the induct or pipe having the chambered enlargement and its flange and annular bevel, arranged as shown and described.

263,696. WATER SINK. WILLIAM J. GRANLEES, Philadelphia, Pa. Filed Dec. 29, 1881. (No model.) Issued Sept. 5. 1882.

Brief.—The strainer C is detachable, and is of diminished diameter at its lower end, which is slotted, and which is provided with the weighted plug D.

Claim.—1. The detachable receiver C, of diminished diameter at its lower end, and having vertical slots *b*, and the screw plug, D, substantially in the manner described and for the purpose specified.

2. The receiver C, having a flange, *d*, at its upper end and openings at its lower end for the passage of water into the discharge pipe, and the plug D, which performs the double function of closing the lower end of the receiver and of acting as a weight to keep the flange *d* in close contact with the bottom plate of the sink, substantially as described.

3. The combination of the receiver C, having a flange, *d*, plug D, and slots *b*, with the sink A and discharge pipe B, the lower end of the receiver being reduced in its diameter to form an annular space, *c*, and a wire *e*, or other suitable device to be used in lifting it, substantially as described.

263,948. WROUGHT-IRON COUPLING FOR PIPE SECTIONS. JAMES O. MORSE, ENGLEWOOD, N. J. Filed Feb. 21, 1882. (No model.) Issued Sep. 5, 1882.

Claim.—A wrought-iron coupling ring composed of a central interior groove or recess and tapered screw threads extending from the ends of the ring to the edges of the groove, substantially as and for the purpose described.

263,984. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF GAS. THEODORE G. SPRINGER, New York, N. Y. Filed Aug. 14, 1882. (No model.) Issued Sep. 5, 1882.

Claim.—1. The process of manufacturing gas consisting of the following steps, to wit: raising a body of carbonaceous material to an elevated temperature or an incasdescent state by means of a blast of air, burning the products of combustion above the same, stirring the resulting heat at a comparatively low temperature in a large body, then decomposing steam by passing it through the highly-heated carbonaceous material, and finally fixing the resulting gases and the vapor of liquid hydrocarbon at a more moderate temperature, whereby the burning or decarbonization of the fixed gas is prevented, substantially as specified.

2. In an apparatus for generating gas, the combustion and generating chamber, and the fixing chamber communicating therewith, the generating chamber being of suitable dimensions for decomposing steam, and the fixing chamber of larger lateral dimensions, whereby the depth of carbonaceous material to form the carbonic oxide necessary for heating is provided for and the proper distribution of the fixing material to prevent destructive decomposition of the oil, vapor, or gas is obtained, substantially as specified.

3. In combination with the fixing chamber of the cupola, the gas eduction pipe leading therefrom, the exhauster and a steam engine for running the same, a thermostatic regulating device connected to the fixing chamber and to a valve in the steam supply pipe connected to the engine, whereby the speed of the exhauster is controlled by the heat of the fixing chamber, and the gas is properly fixed without destructive decomposition or decarbonization.

4. In the manufacture of illuminating gas, the process of uniformly combining and fixing the water gas and hydrocarbon vapors and preventing destructive decomposition or decarbonization of the hydrocarbons, which consists in automatically withdrawing the gas faster or slower from the fixing chamber, and thus retaining it for a shorter or longer period in contact with the heated fixing material in proportion to the heat of the fixing chamber.

5. The combination, with the fixing chamber and the combustion chamber and generator of the apparatus and the air, steam, and oil supply pipes, of the exhaust pipe and the exhauster, arranged to operate substantially as specified.

6. In a gas generating apparatus, the combination of a generating chamber containing carbonaceous material, and a connected fixing chamber containing refractory material, the fixing chamber being greater in transverse area than the generating chamber, whereby the steam is compelled to pass through a sufficient body of carbonaceous material to be thoroughly decomposed into carbonic oxide and hydrogen, and the resultant gases are diffused laterally to a greater extent than the lateral passage of the steam, so as to decompose the liquid hydrocarbon, and at the same time prevent destructive decomposition of the gas, substantially as specified.

263,985. PROCESS OF AND APPARATUS FOR THE MANUFACTURE OF GAS. THEODORE G. SPRINGER, New York, N. Y. Filed Aug. 14, 1882. (No model.) Issued Sep. 5, 1881.

Claim.—1. The process of generating water gas and utilizing the heat of the gas for heating air and superheating steam, which consists in first raising to incandescence a body of carbonaceous material by a blast of air and burning the resulting hot products of combustion by an air blast and storing the heat in a body of refractory material superheating steam by passage through such refractory mareria, then decomposing such steam by passing it through the incandescent fuel and passing the resulting hot gas through a body of refractory material and storing the heat, at the same time cooling the gas, continuing the operation until the fuel is reduced below the decomposing temperature, then heating a blast of air by passage through the last-mentioned refractory material and forcing such air through the carbonaceous material for again raising it to incandescence, and burning the resulting gaseous products and storing the heat in the steam-superheating body of refractory material, as at first, and thus continuing the operation.

2. The process of generating gas, the same consisting in passing steam, superheated or otherwise, through a column or body of incandescent carbonaceous material at different heights, drawing off the resulting gases at different elevations, and renewing the carbonaceous material as it is consumed, whereby gases of different qualities—that is, poorer and richer gases—are simultaneously carried off and mixed together, forming a homogeneous gas.

3. The combination, in a gas-generating apparatus, of a generator having horizontal tuyeres and eduction passages at different elevations, and one or more heat-storing chambers connected with the generator by means of flues, and suitable means for admitting or forcing air and carrying off gas, substantially as specified.

4. The combination, in a gas generating apparatus, of a generator having horizontal tuyeres and eduction passages at different elevations, and one or more heat storing chambers connected with the generator by means of flues, and suitable air and steam supply pipes and gas eduction pipes, and act feed-magazine located above the generator, the generator being provided with an aperture at the bottom, through which the ashes may be run off as slag to make room for fresh material, which is fed automatically by the magazine, substantially as specified.

5. The combination, in a gas generating apparatus of a generator having one or more tuyeres and one or more eduction passages, the heat storing and superheating chamber F, having connecting steam and air pipes and an escape flue for waste products of combustion, the heat-storing and air-heating chamber F [1], having the connecting gas eduction pipe and air supply pipe, and suitable connecting flues, for the purpose described.

263,716. STEAM TRAP. JOHN MOREHEAD, Detroit, Mich., assignor of one-half to Louis F. Herbst, same place. Filed July 11, 1882. (No model.) Issued Sept. 5, 1882.

Claim.—1. An automatic steam trap for the discharge of condensed water from steam pipes, consisting of a suitable receiving chamber, an inlet steam pipe which traverses the chamber at one side of the centre of gravity and constitutes an axial support upon which the receiving chamber may be tilted, an interior pipe connected therewith and carrying the steam above the water in the chamber, a discharge pipe having its valve within said chamber, a lever arranged within said chamber and adapted to hold the valve closed when the receiving chamber is in a horizontal position and leaving it free to operate when said chamber is tilted out of such position, and in combination therewith means whereby it shall be caused to occupy a horizontal position when relieved of its surplus water, substantially as described.

2. An automatic steam trap for the discharge of condensed water from steam pipes, consisting of a suitable receiving chamber, an inlet steam pipe traversing said chamber at one side of the centre of gravity and forming a limited axis therefor, and interior pipe connected therewith adapted to carry the steam above the water in the receiving chamber, a discharge pipe provided with a suitable interior valve and valve stem, a lever constructed and adjusted to rest upon the valve-stem when the receiving chamber is in a horizontal position and to release its pressure upon the valve-stem when the receiving chamber is tilted out of said position, and in combination therewith means whereby said chamber shall be caused to occupy a horizontal position when relieved of its surplus water, the whole construction being such that when the water unduly accumulates in the chamber it will tilt said chamber, relieve the valve from the pressure of the lever, and permit the pressure of the steam upon the water to open the valve and discharge the water until the equilibrium of the chamber is restored, substantially as described.

3. An automatic steam trap for the discharge of condensed water from steam pipes, consisting of a suitable receiving chamber provided with a cock and weighted lever, an inlet steam pipe, an interior pipe connected therewith adapted to carry the steam above the water in the receiving chamber, a strainer below the orifice of said pipe, a discharge pipe provided with a suitable valve connected by a blank joint to the inlet pipe, said valve provided with a valve stem, a lever constructed and adjusted to rest upon the valve-stem when the receiving chamber is in a horizontal position and to release its pressure upon the valve when said chamber is tilted out of such position, and in combination therewith suitable stuffing boxes whereby the receiving chamber is pivoted upon the inlet and discharge pipes, substantially as described.

4. An automatic steam trap for the discharge of condensed water from steam pipes, consisting of a suitable receiving chamber provided with an air chamber, cock and weighted lever, an inlet steam pipe, an interior pipe connected therewith adapted to carry the steam into the air chamber, a discharge pipe provided with a suitable valve connected by a blank joint to the inlet pipe, said valve provided with a valve-stem, lever constructed and adapted to rest upon the valve-stem when the receiving chamber is in a horizontal position and to release its pressure upon the valve, when said chamber is tilted out of such position, and in combination therewith suitable stuffing boxes whereby the receiving chamber is pivoted upon the inlet and discharge pipes substantially as described.

5. In a steam trap for the discharge of condensed water from steam pipes, a suitable receiving chamber provided with an air chamber, said air chamber provided with a strainer, substantially as described.

264,087. VALVE. JAMES JONES, St. Louis, Mo. Filed June 6, 1882. (No model.) Issued Sept. 12, 1882.

Claim.—1. The combination of the valve E, the collar F, having the flange f^1, the stem D, the screw G, the collar H, the cap I, and the valve chamber E, substantially as described.

2. The combination of the chamber E, the cap I, the collar H, having the flange *h*, and the stem D, substantially as described.

263,988 ELECTRIC ARC LAMP. JEAN AUGUSTE MONDOS, Neuilly, Seine, France. Filed Jan. 6, 1882. (No model.) Patented in France Nov. 11, 1881. Issued Sep. 5, 1882.

263,944. PUMP. PHILIP A MYERS, Ashland, Ohio, assignor of one-half to Francis E. Myers, same place. Filed June 22, 1882. (No model.) Issued Sep. 5, 1882.

263,975. ROTARY PUMP. AUGUST SIEGRIST, Buffalo, N. Y. Filed Nov. 12, 1881. (No model.) Issued Sep. 5, 1882.

A Valuable Book of Reference.

THE FIFTH VOLUME OF
THE SANITARY ENGINEER,
OF NEW YORK,
Includes the twenty-six weekly issues from December 1st, 1881, to May 25th, 1882.

A complete record of all United States Patents for fixtures and appliances used in plumbing, sewerage, gas fitting, gas manufacture, steam and hot water heating, ventilation, and electric lighting, makes it valuable to inventors and manufacturers.

The following are a few of the many articles of permanent interest:

A review of town sewering in England, with opinions on the question of small *versus* large sewers, or the combined *versus* the separate systems, by Robert Rawlinson, C.B, Chief Engineer, Inspector Local Government Board, England.

A report on the Sewerage of Concord, by Edw. S. Philbrick, C.E., instructive to town authorities generally.

Remarks by John S. Billings, Surgeon, U. S. Army, before the Academy of Medicine, New York, on sewer gas and the value of modern methods for excluding it from houses. This article throws considerable light on a question generally misunderstood.

Electric Lighting; its Fire Risks and their Remedies. Two articles by Prof. Henry Morton, President Stevens' Institute of Technology, Hoboken, New Jersey,

Illustrations, with description of the Arrangements for Heating and Ventilating the Bridgeport School House (intended to be a model building).

A continuation of Dr. J. S. Billings' Letters to a Young Architect on Ventilation and Heating, with illustrations of notable buildings.

A continuation of the "Sanitas" articles on Plumbing Practice (illustrated). Interesting to architects, builders, and plumbers.

Steam Fitting and Steam Heating, by "Thermus," a series of practical articles (illustrated), of great value to steam fitters and architects.

Illustrated Descriptions of notable jobs of Plumbing Heating, and Ventilating in Private Residences in the United States, including those of Mr. W. H. Vanderbilt and Mr. R. H. Bishop, of New York.

A series of articles on Petroleum Legislation in the United States, by E. G. Love. Ph. D.

A Report to the Greenock Board of Police on the Ventilation of the Sewers of Thirty-three Towns in England, compiled from information received from City Engineers, by Alex. J. Turnbull, C.E. Valuable to engineers and health officers.

A series of carefully prepared editorials on the Water Supply of New York, discussing the various schemes proposed for increasing it; also the measures to prevent waste. Opinions of prominent English engineers on the practice in England, and suggestions for American adoption, in connection with a controversy over the rules of the New York authorities with regard to the manner of flushing water closets. The letters and articles on the question of Valve *versus* Direct Supply to Water Closets are of great interest to manufacturers, plumbers, health officials and water works engineers.

Reports on Adulteration of Food and Drugs in the State of New York, being full abstracts of the reports of Professor Chas. F. Chandler, on Milk (fresh and condensed); Prof. G. C. Cornwell, on Butter (dairy and artificial), Cheese, Lard, Olive Oil, and Fruit Essences; by Professor A. H. Chester, on Canned Meats and Animal Foods; by Dr. E. G. Love, Ph.D., Cereals and the Products and Accessories of Flour, Special Artificial Foods for Infants and Idvalids, Baking Powders, Cream Tartars, Alum Powders and the "Alum Question;" by Professor A. S. Lattimore, on Canned Fruits and Vegetables, Vinegar Spices, etc.; W. H. Pitt, M.D., on Sugars, Glucose, etc.; J. E. Englehardt, Ph.D., on Wines, Beers, Spirits and Cordials; by J. Hoffman, Ph.D., on Crude Vegetable and Animal Drugs, Pharmaceutical Chemicals and their preparations; by Professor Caldwell, on Quinine Pills and Capsules: by W. G. Tucker, M.D., on Citrate of Magnesia and Seidlitz Powders.

These reports are on examinations made under the direction of the New York State Board of Health with a view of ascertaining the condition of the Food and Drug supply in the State, and the extent and charaeter of the adulterations practiced. They are valuable to health officials, analysts, and manufacturers.

Notes upon some Prosecutions in Great Britain under the Food and Drugs Act, by Alfred Senier, M.D, F.C.S.

Paris Street Cleaning, by James Tallmadge Van Rensselaer. An elaborate and full account of the system and the cost of its maintenance—of value to city authorities.

Washington Drainage, a carefully prepared review of the evils complained of, and the various schemes proposed for the reclamation of the Potomac Flats and the sewerage of the city.

Price, bound in cloth, $3.00. Postage 40 cents.

Address
THE SANITARY ENGINEER,
P. O. Box 3037, 140 WILLIAM STREET, N. Y.

For sale in London by E. & F. N. Spon, 16 Charing Cross, @ 15 shillings.
In Leipzig by F. A. Brockhaus, Querstrasse 29, @ 16 marks.

Employment Wanted.

Under this head we will insert advertisements, not exceeding four lines, free of charge, for persons seeking employment. This privilege is restricted to persons employed by *Architects, Civil Engineers, Chemists, Electric Light Companies, Gas Companies, Plumbers and those engaged in the business of Heating by Hot Air, Hot Water and Steam.*

PLUMBERS' Supplies.—A position as Manager in this line desired by a party who has fourteen years' experience in the trade. Can furnish first-class references.
R. H., Sanitary Engineer Office.

A GENTLEMAN, thoroughly familiar with Plumber's Materials, desires a situation with some good house, either on the road or in the office. Can furnish the highest reference.
Address, A. B. C., THE SANITARY ENGINEER Office.

WANTED:—Young man with two years' experience at Engineering and Draughting, college graduate science department, desires situation as Assistant Engineer, Surveyor or Draughtsman, or sit with Architect or in similar employment. References.
Address, B. F. CHANDLER,
Boston, Mass.

A JOURNEYMAN Plumber, with 16 years' experience, wants work in or around New York.
James Hagan, 535 Washington St., N. Y.

A JOURNEYMAN Plumber of 12 years' standing, wants work in or near New York City. Address,
Jno. Stanton, 179 W. Houston St., N. Y.

PLUMBER wants situation, city or country. Only left last place Nov. 18th. Refers to Bixby & Woods, Council Bluffs, Iowa, also parties in this city. Address, P. P., Office Sanitary Engineer.

DESIGNER and Mechanical Draughtsman desires engagement. Thoroughly acquainted with Process work, also Architectural and Engineering work. Louis C. Denis, Jr., 291 Pearl St., N. Y.

A COMPETENT Sketch Artist desires employment. Prefers some city engagement.
Address, W. H. S., this office.

A PRACTICAL Steam Fitter of 27 years' standing seeks a position. Address, Jno. Hughes, 315 10th Av., N. Y.

A STEAM Fitter, who has been in the business 15 years, wants a situation. No objection to going out of city.
Francis Boyle, 158 W. 28th St., N. Y.

A PLUMBER, with 18 years' city and country experience, desires a situation.
Address, James O'Keefe, 321 Pacific St, Brooklyn, N. Y.

A DESIGNER and Mechanical Draughtsman, (who is also familiar with sketching for engravers), desires a permanent position.
Address, Designer, 78 Day St., New Haven, Conn. (Care R. S.)

Proposals.

GOVERNMENT HOSPITAL FOR THE INSANE,
WASHINGTON, D. C., *Dec.* 5, 1882.

Proposals for laying a water main from Washington, D. C., to the Government Hospital for the Insane across the Eastern Branch of the Potomac River.

Sealed proposals are invited for laying an eight-inch water main from the grounds of the Washington Barracks at Greenleaf's Point to a point on the grounds of the Government Hospital for the Insane. Further particulars and profile of the river can be obtained by addressing the undersigned. Proposals should be sealed, marked "Proposals for laying water main," and addressed to the "Superintendent of the Government Hospital for the Insane, Washington, D. C." All proposals received will be opened at noon, January 4, 1883.

The right to reject all bids is reserved.
W. W. GODDING, *Superintendent.*

Building crib, bulkhead, and platform at foot of 79th street, East River. Until Dec. 18. Address BOARD OF COMMISSIONERS, Department of Docks, New York City.

Furnishing stop cocks and hydrants and laying 48-inch cast iron conduit pipe. Until Dec. 27. Address DEPARTMENT OF PUBLIC WORKS, New York City.

Building monument at Yorktown, Va. Until January 4. Address RICHARD M. HUNT, Tribune Building, N. Y. City.

Building self-acting draw-bridge over Miami and Erie Canal. Until Dec. 23. Address W. S. CAPPELLER, *County Auditor*, Lockland, O. Also, same address and date, building the foundations and aprons of the bridge.

Erecting new City Hall and Market-House in the city of Indianapolis. Until Dec. 16 Address CITY HALL AND MARKET-HOUSE COMMISSIONERS, Indianapolis.

Dredging and Pier Extension in Calumet Harbor, Ill. Until Dec. 21. Address W. H. H. BENGUARD, *Maj. of Engineers*, U. S. Engineer Office, Chicago, Ill.

Erecting Brick School Building at Kiowa, Comanche, and Wichita Agency. Until Dec, 28. Address P. B. HUNT, *U. S. Indian Agent*, Anadarko, Ind. Ter.

Excavation, building wall of granite masonry, laying concrete, putting down 6 x 12 in. sewer pipe at Government Reservation at Hot Springs, Ark Until Dec. 15. Address H. M. TELLER, *Secretary*, Department of the Interior, Washington, D. C.

Furnishing encaustic or slate tiling and base for the Institution of Feeble-Minded Youth, Columbus, Ohio. Until December 7. Address, BOARD OF TRUSTEES.

Dredging in Rappahannock River, Va., Urbana Creek, Va., St. Jerome's Creek, Va. Until Dec. 21. Address, S. T. ABERT, U. S. Engineer Office, Washington, D. C.

Extension of Oswego Breakwater. Until Dec. 15. Address, WALTER McFARLAND, *Maj. of Engineers*, U. S. Engineer Office, Washington, D. C.

Dredging in Archer's Hope River, and Norfolk Harbor, Va. Until Dec. 22. Address. JAMES MERCUR, *Captain of Engineers*, U. S. Engineer Office, Norfolk, Va.

Extension of Buffalo Breakwater. Until Dec. 15. Address, WALTER McFARLAND, *Maj. of Engineers*, U. S. Engineer Office, Oswego, N. Y.

Material and labor for Water Works. Until Dec. 9. Address, BOARD OF WATER COMMISSIONERS, Sherburne, N. Y.

THURBER'S PURE

Flavoring Extracts.

The difficulty experienced in obtaining high grade Extracts of uniform quality has induced us to undertake the manufacture of these delicate specialties ourselves. In accordance with our policy of having every department of our business as nearly perfect as possible, we have fitted up a complete *Laboratory*, placed it in charge of an expert Chemist, and propose to furnish the consumer an assortment of FRUIT FLAVORS and EXTRACTS which cannot be excelled. In the manufacture of Extracts we possess unequalled facilities through our connections abroad, and especially in the Mexican trade, whence we procure supplies of VANILLA BEANS DIRECT FROM THE PRIMARY SOURCES OF SUPPLY. In order that consumers may obtain a pure and unadulterated manufacture of the Prince of Flavors, we have prepared without regard to expense an Extract which we warrant to be strictly free from any flavor except that derived from the finest MEXICAN VANILLA BEAN. The connoisseur will, upon trial, at once recognize it as perfectly pure, and entirely free from the usual adulteration, consisting more or less of foreign substances, generally flavored by the Tonka Bean, which gives satisfaction to some but is easily detected by its strong, pungent and acrid flavor.

All of our Extracts will be found of the same pure and delicate flavor as the Vanilla. If you cannot procure Thurber's Extracts of your Grocer, send us a Postal Card and we will see that you are supplied.

H. K. & F. B. THURBER & CO.,

WEST BROADWAY, READE AND HUDSON STREETS.

NEW YORK

LONDON BORDEAUX.

P.S.—As the largest dealers in food products in the world, we consider it our interest to manufacture only pure and wholesome goods and pack them in a tidy and satisfactory manner. All goods bearing our name are guaranteed to be of superior quality, *pure and wholesome*, and dealers are authorized to refund the purchase price in any case where customers have cause for dissatisfaction. It is therefore to the interest of both dealers and consumers to use *Thurber's brands.*

The Automatic Electric Furnace Regulator Will keep your furnace under absolute control by the temperature of the living room. A small thermostat hung on the wall will, with one degree variation, open and close the draughts of the furnace and maintain a uniform temperature under all conditions of the weather. Will control a steam, hot-water, or hot-air furnace. Send for circular to PERFECT HATCHER CO., Elmira, N. Y.

Liverpool London & Globe Insurance Co., 45 William Street.

Directory List.

The following firms solicit correspondence, and will furnish illustrated circulars, if request d. It is desired that this paper be mentioned when application is made.

ARCHITECTS' AND ARTISTS' SUPPLIES.— Wadsworth Bros. & Howland, 84 Washington Street, Boston, Mass. Catalogues on application.

DRAWING AND SURVEYING INSTRUMENTS and Materials. G. S. Woolman, 116 Fulton Street, New York. Send for Illustrated Catalogue.

DUMB WAITERS.—Hydraulic Double-acting Dumb-Waiters, or Single-acting, manufactured by the *Granville Hydraulic Elevator Co.*, 1193 Broadway, N. Y.

ELEVATORS.—Hydraulic, Passenger, Freight and Side-walk Elevators, m'f't'd by the *Granville Hydraulic Elevator Co.*, 1193 Broadway, N. Y. Send for Illustrated Circular.

FOOD PRODUCTS.—H. K. & F. B. Thurber & Co., New York. Reliable Food Products. Importers, Manufacturers and Dealers.

GREEN HOUSE HEATING BY STEAM.—Gillis & Geoghegan, 116 and 118 Wooster Street, New York, N. Y.

HEATING.—Dwellings and Green Houses Heated. Boilers for Heating Water. Charles R. Ellis, Centre cor. of Hester Sts., N. Y.

INJECTORS.—Nathan & Dreyfus, 94 *Liberty St., N. Y.* Oil cups, Lubricators, etc. Send for Catalogue. P. O. Box 3746.

PATENTS.—Solicitor and Attorney.—Chas. J. Gooch, Washington. D. C. Over 18 years' *successful* practice. Reliable service at moderate rates. Good references. *Advice free.*

PLUMBERS' BRASS WORK.—Fine Goods. Special prices. Hedges & Bro., Newark, New Jersey.

PLUMBERS' SUPPLIES.— Meyer, Sniffen & Co., 46 and 48 Cliff St., N. Y. The Hellyer Water Closet and Royal Porcelain Bath Tub.

STEAM BOILERS.—The Babcock & Wilcox Co., 30 Cortlandt St., N. Y. Manufacturers of Safe, Economical and Durable Water Tube Steam Boilers.

WROUGHT IRON PIPE.—Pancoast & Rogers, 28 Platt St., N. Y. Wrought Iron Pipe, Boiler Tubes, Cast Iron Water and Gas Pipe. See advertisement.

Chas. Butcher & Co.

MANUFACTURERS OF

PARQUET FLOORS

AND

The Boston Polish,

or Hard-Wax Finish.

Office, 171 Tremont St., BOSTON, MASS.

The Boston Polish is the only thing really adapted to Polishing Hard Wood Floors.

The Boston Polish is recommended by leading architects in Boston for both inside finish and floors.

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration. Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

MANUFACTURED BY THOS. TWYFORD, HANLEY, STAFFORDSHIRE, ENG.

Sole Agent for the Manufacturer,

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP FOR Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.
204 *Superior Street*,
CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL S TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S
IMPROVED
IRON SEWER GAS
AND
BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER
SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

JEWETT & SONS PERFECTLY PURE WHITE LEAD TRADE MARK

J. A. DEAN'S PERFECTLY PURE LINSEED OIL JEWETT & SONS AGENTS

181 *Front Street, New York.*

TWO years ago the undersigned introduced to the trade in this country THE ROYAL PORCELAIN BATH.

Prior to that period it was little known, except to those Americans who may have seen them when traveling in Great Britain; while it is true that they had been used there for 25 years, and were universally conceded to be the finest thing in the way of a Bath Tub known, yet, like all things supposed to be new and of high cost, they required extensive advertising to secure their acceptance and use to any considerable extent in the United States.

The effect of numerous expressions of opinion, made without either knowledge or experience to justify them as to their durability and utility, had to be counteracted, yet, as a result, we have succeeded in having them selected for some of the most elegant residences that have been erected within the past ten years. They have also been used in several hospitals, for which places we make a special, less elaborate, and cheaper class of fittings.

A personal inspection will convince any one of their superiority. Their increased cost over that of an ordinary copper-lined bath tub should not be a consideration to those who can afford to live in a house worth over $15,000, and would not be if their cleanliness, inviting appearance and durability was appreciated.

MEYER, SNIFFEN & CO.

46 & 48 Cliff Street,
New York.

N. B.—We have imported a line of sinks, which are made of the same non-absorbent material as the ROYAL PORCELAIN BATH TUBS. They are admirable for Hospitals. They have been used in some of our elegant New York residences, where their expense was no objection. They are one and one-half inches thick, and are less likely to be broken than cast iron. We have a size in stock that would make an admirable "Foot Bath."

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat.) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open. steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

CREQUE'S PATENT

New Circulation

RANGE BOILERS

13 different styles—adapted and warranted for every possible situation.

ESSENTIAL FEATURES.

1st. Cold water is introduced at the bottom of the boiler, while hot water is injected into the top of the boiler.

2d. By this system the chilling of the hot water in its passage to the top of the boiler is avoided.

3d. Hot water being stored at the top of the boiler without chilling, it can be used immediately; thus making the boiler serviceable as soon as the water-back is heated.

4th. The circulation is positive in direction and rapid in action, and heats in very much less time.

5th. Circulation being positive, there is no cracking, snapping or rumbling in the boiler.

6th. There being no reversal of circulation, there is no sudden expansion and contraction of the boiler shell. The boiler will therefore wear longer.

7th. In case of a part of the boiler being filled with steam, a sudden injection of cold water does not condense it, as the injection is at the *bottom* of the boiler, thus forcing the heated water above it to fill the space left by escaping steam, when a hot water cock is opened.

8th. A considerable saving in material and labor in cost of setting up the boiler and connecting pipes.

9th. In consequence of a rapid, invariable and constant circulation, much more hot water can be obtained from a small sized boiler than from a much larger boiler of the old method of circulation. These boilers are arranged to meet every conceivable requirement of location or condition. To both the plumber and architect this is a great advantage, while it also lessens the cost to the builder.

N. B.—Please send for Catalogue fully explaining the various situations for which these boilers are intended.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to dispense with what are called mechanical parts. This would be desirable, if the so-called mechanical parts did not secure advantages in the matter of a large body of water in the bowl, not otherwise obtainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as practicable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between the Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with water, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had them in use in our factory nearly two years—and we now offer them to those who prefer a different form of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we know, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Clift Street, New York, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have fitted up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL PORCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE RHOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

MEYER, SNIFFEN & CO.

PHILLIPS & WEEDEN'S
PATENT
SANITARY HOPPERS

The only Perfect Ventilated Hopper made.
Recommended by the highest Sanitary Authorities in the United States.

Patented in the United States, July 25th, 1882.
PATENTS APPLIED FOR IN CANADA.

SECTION.

The above cut represents a section of our Patent Ventilating Hopper. *A* is the basin projecting into the lower chamber *B*, leaving the space *e* between each. *D* is a ventilation duct at the side, having openings into the lower part of the hopper at *c* and into the upper part at *d*. Connection being made with *D* to a pipe leading to the outer atmosphere, an outward draft is thus created, removing all foul and offensive odors through the openings *c* and *d*. When the Hopper is flushed the rush of water forces the air in *B* into the duct *D*, making doubly sure the complete removal of all obnoxious gases.

The advantages of this over the ordinary Water Closets in use are easily seen :—

Complete Ventilation.

Constructed in one solid body of crockery, there are no putty joints to absorb obnoxious gases.

They are thoroughly cleaned every time water is used.

No metals being employed, oxydization cannot take place, and so form a rough surface for filth to adhere to.

No. 3 VENTILATED HOPPER.

This is designed for tank supply only, being furnished with a flushing rim which thoroughly washes every part of the hopper. It is furnished with a brass connection for supply, so that *no putty is required*, a perfect joint being made.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

RIVER POLLUTION.

Under the above heading the *Westminster Review* for October contains an article by U. A. Forbes, which relates the troubles of the inhabitants of the lower Thames valley caused by the large discharge of sewage into the river from London and the metropolitan district.

The picture drawn is a gloomy one, and the remark of the Chairman of the Committee of the Metropolitan Board of Works, viz., "We have got rid of our sewage and with the sanitary aspect we have nothing to do," is quoted as illustrating the spirit in which the matter is viewed by the London authorities. Mr. Forbes thinks that in its legislation on the subject Government has begun at the wrong end of the question.

"When by the Public Health Act it established the system of sewer drainage, it prescribed down to the minutest details as to sewers, traps, flushing sewers, etc., all that it required local authorities to do in order to carry it out. Now that that system, after great expense and labor has been perfected and found to be unworkable, it, without help or warning of any kind, calls on these same authorities to find out some other mode of dealing with the question."

This does not seem to us to be by any means a fair statement of the case. The Government has shown how the house ends and the general system of sewerage may be arranged so as to avoid danger to health. It has not shown how the sewage can be best finally disposed of, though it has forbidden its disposal so as to contaminate water supplies. Since the best method of disposal of sewers varies in individual cases, it is pre-eminently a local question, to receive a special solution in each locality.

This is by no means equivalent to saying that each locality should be the final judge as to how it shall dispose of its sewage. But until some changes are made in the present organization and relations of the Local Government Board, one of the most important of which would be a change in its present Chief, it would not produce any good results to increase its authority in this or other matters.

Our attention was called to the following advertisement in a daily paper:

"A SITUATION WANTED—BY A YOUNG MAN AS Porter; understands plumbing and gas fitting; a handy man around hotel, or as watchman."

It is just such handy men that in attempting to do plumbing sometimes cause a great deal of trouble. If this advertiser was a good plumber he could earn from three to three and a half dollars a day. A porter's wages are about two dollars; the advertisement therefore implies that he is a better porter than plumber.

The average hotel plumber is a dangerous man to have around, and if the registration provisions of the plumbing law were strictly enforced in this city these men would be prevented from tampering with work that none but a skilled plumber should touch. If the plumbing societies want to perform a real service they should appoint a first-class committee which should make it its business to look after men not registered, and see that the law is carried out. The medical societies are constantly hunting out the frauds and quacks, and they are vigilant in seeing that the law for such cases is enforced. This is what reputable plumbers should do.

Our representative who was sent to verify another case of flagrant violation of the plumbing law reported by Inspector Hollick last week reports as follows:

The following defects were found in the six houses on the north side of 94th street, beginning about 100 feet east of Lexington avenue (James H. Havens, Jr., owner; McDougal, plumber, of 198 East 74th street). Traps on basin and sink wastes improperly ventilated, the air pipes starting not from the crown of the trap but at a considerable distance away, in some cases two or three feet, where the waste was nearly horizontal. The object was evidently to save pipe. In one case the wastes from two basins in adjacent rooms had a common air pipe which started from the pipe below the junction of the two.

Iron ferrules used instead of brass on the smaller connections between lead and iron pipes.

T-branches on the iron house drain receive a part of the smaller wastes. The rain leaders are not trapped.

In the six houses on the south side of 97th street 300 feet west of Second avenue, in which the same man, McDougal, did the plumbing, there were T-branches as in the others, the house drain was much out of alignment, and the T for the fresh air inlet was on the side of the pipe in a horizontal position. The name of Samuel Simmons appears as the owner, although Budenseick is recognized as the builder.

It was stated at the Board of Health that the plumber, Lamarche, paid no attention to the notices of the Board directing his removal of the violation consisting of open hubs and unventilated water closet traps (described in THE SANITARY ENGINEER of Dec. 7) until the matter was put in the hands of the attorney. On the second day thereafter a workman was found making the connections.

It is gratifying to be able to state that the Board are beginning to realize that nothing short of vigorous measures will do when dealing with mechanics of this class. We hope they will soon decide to test the question of their power to prevent these men from doing plumbing work in this city. The law was intended to give them such power and we believe it does.

Since the foregoing was written, we learn that a warrant has been issued for the arrest of McDougal.

The London *Morning Post* of October 31 gives a glowing description of the new City of London school just finished, at a cost of over $500,000. The marble staircases, pillars and mosaics, stained windows, and gilded tablets are dwelt

Digitized by Google

upon but the ventilation is dismissed with the remark that "it seems to be perfect." It ought to be when we are told that the great hall, measuring 100 x 45, is to hold 800 people. That is, each person is to have less than six square feet of floor space. We fancy it would be very safe to wager that the ventilation will be very far from being perfect, and that the marble and stained glass and gilding will do very little to prevent the evil results of impure air. We should be glad to know what Dr. Abbott, the principal, thinks of this about the end of January next.

The smells of Bellevue Hospital grow with their years, according to the report of the visiting committee to the State Charities Aid Association. The plumbing is bad and the pavilion is a battle-ground for rats and mice. A plan adopted, after urgency by the visitors, for improving the plumbing by isolating it in towers has only succeeded so far as to produce the comment by them that "we doubt if any architect ever succeeded in spending so much money with results so absolutely inconsistent with decency and convenience." Whether the architect carried out his own ideas or those of the managers of the institution, the report throws no light on. The visitors again recommend a plan for the same object, specifying in detail the results to be secured. It is evident that they are on the right track, and it is also evident they should have employed expert services in compiling this technical portion of their report, which is now too obscure to be of much use to anyone. That portion of their report which will undoubtedly most interest and gratify the general public is the almost unqualified praise which they give to the success of the movement to establish a training school for nurses at Bellevue. Begun with doubts as to its success, and in face of certain strong popular prejudices, to-day the visitors feel authorized to say that had "the committee initiated no other work since its organization, ten years since, its members could feel that they had done much to justify their existence and entitle them to commendation."

The special examination by the Health Department, of the plumbing in the private schools of Brooklyn, now in progress, is likely to result in great good. Over 150 schools have been inspected, and many found in bad condition. The proprietors of all of the latter receive notice to correct the defects at once. Health Commissioner Raymond proposes to have the plumbing in all the private schools of the city in good condition by the end of the holiday vacation. His report of this examination will be an interesting document, which we hope to present to our readers before long.

THE NATIONAL BOARD OF HEALTH.

The following is from the *Nation* on the present position of the National Board of Health:

"One of the most remarkable examples of contemptuous disregard for the public good is the Congressional action that has placed the National Board of Health in a state, practically, of suspended animation. In 1879 this Board was organized by law, in response to vigorous appeals from sanitarians. It was charged with advisory functions in regard to the public health, and with coöperation, so far as was legal, with local boards against the introduction of foreign disease. This latter duty was required by a special law, known as the Quarantine Act, that expires by limitation in 1883. The dual form of government, the jealousy of State authorities, and the extreme repugnance of commercial communities to restrictive measures that affect their particular interests, made protective expedients very difficult to devise and carry out. And, indeed, it is only through local authority that any positive work can be done. Notwithstanding these obstacles, the National Board succeeded in limiting the spread of epidemic diseases without materially interfering with traffic—notably when yellow fever threatened the Mississippi Valley—as had never before been done. In its advisory capacity it set on foot important investigations as to certain preventable diseases, with very encouraging prospects; it practically suppressed the small-pox of immigration that threatened the North-west; and it accomplished the whole within the moderate appropriations with which it was endowed But in some way friction, especially with the Louisiana Board, was generated; an undertone of complaint not yet vented in open charges has been heard in New England; objection was made on the floor of the House to agents of the general Government inquiring into the cause of disease: gross misstatements as to its expenditures were announced in Congress; and, that body, repenting the good it had done, or forgetful of the past and unmindful of the future, crippled both the resources and the jurisdiction of the Board. Finally, when $100,000 was placed in the President's hands to use against epidemic disease, he made the Marine Hospital Service his agent, and the National Board found constructive insult added to the injury that, as a scientific body, it had already received. It would be strange if a new organization, with such delicate functions, should not have committed some errors; but it is safe to say that a small non-political council that contained such men as Cabell, of the University of Virginia, Bowditch, of Massachusetts, and Bemiss, of Louisiana, could not go far astray in either aim or method. A preliminary report on the yellow fever in Texas, by the Surpervising Surgeon-General of the Marine Hospital Service, shows that a *cordon sanitaire*, extending for several hundred miles, was the particular and effective means employed to defend the uninfected regions."

DISINFECTION.

The fifth report of the Commissioners of Prisons of England for the year 1881-82 contains in the appendix an interesting report by a committee, on the best mode of cleansing and disinfecting the private clothing of prisoners, from which we make the following extracts:

"After giving the subject the very serious consideration it deserves, we have arrived at the conclusion that the most effectual disinfectant is heat; in fact, it is the only one with which we have experimented that has not failed in one or the other of the points above mentioned.

"1st. We would suggest that each prison should be furnished with a hot air chamber, of a size proportioned to the prison.

"We think in very large prisons it might be desirable to have one for the females as well as the males.

"That this room should be fitted with racks divided into compartments.

"That each prisoner's clothes [boots excepted] should be placed very loosely in one of these compartments.

"That the heat should then be raised to 245° Fahr., and kept at that temperature for two hours.

"The boots, which will not stand this temperature without damage, we recommend should be exposed to the outer air for forty-eight hours before being finally placed with the other articles of clothing in the private clothing store room.

"Hard felt hats are also likely to suffer from being subjected to such a heat, but we do not think that they should be exempted from the process."

We have to go away from home to learn all about New York, and the farther we go the more we learn. The Atlanta, Georgia, *Times* says "that Broadway is paved with Belgian pavement, and, when well laid, it is said that it will last a century without repairs." There's the rub. That is what every advocate of every pavement says, but the trouble is, that they are never "well laid" when the time comes that their defects appear. The Broadway pavement, however, was a good pavement when laid, and until the subterranean experimenters got hold of it. But it is not the "Belgian" pavement. That name is used to designate the pavements made of blocks of trap rock which are square on top and laid on sand foundation. The Broadway pavement is of granite, in blocks longer and narrower than "Belgian" blocks, and it is, or was, laid on a concrete foundation. How much concrete there is now in the lower part of Broadway where the various private companies have been tearing up the steeet, no one can tell. The numerous excavations have broken the bond of the concrete, and also of the pavement, and the roadway of this, the most heavily travelled street in America, is execrable. And it is likely to continue so until we get a Board of Aldermen that will abstain from giving unlimited privileges to their friends to override the officers who are supposed to control the streets.

Under date of November 6, 1882, Dr. Hamilton, Supervising Surveyor-General of the Marine Hospital Service, makes a report to the Secretary of the Treasury upon the yellow fever epidemic on the Rio Grande.

From this it appears that the total number of cases at Brownsville and Point Isabel, from August 1 to November 4, was 2,030, with 117 deaths, which is certainly an extraordinarily low mortality, so low in fact that one can hardly help suspecting that many of the so-called cases were not really yellow fever.

The measures relied on by the Treasury Department to prevent the spread of disease, were first, the establishment of a *cordon sanitaire* to restrict travel to and from the infected district; second, the maintenance of a hospital for the sick; and third, disinfection.

The cordon was established by guards for a distance of one hundred and sixty miles. The period of detention of persons from the infected district was ten days, and baggage presumed to be infected was not allowed to cross at all. The total expense to September 30 amounted to $26,856.23.

THE EDISON SYSTEM OF WIRING BUILDINGS FOR THE INCANDESCENT ELECTRIC LIGHT.

No. II.

(Continued from Page 28.)

One form of cut-out used in ordinary buildings was not mentioned in the proper place. It is that used on main horizontal lines where branches are taken off to fixtures. Generally branch lines are connected with the mains by winding the smaller wire tightly around the larger (after both have been scraped clean) and soldering them together, but this cut-out provides for connections by binding screws.

FIG. 1.—PLAN OF CUT-OUT FOR FLOOR MAINS, WITH BRANCH CONNECTIONS.

Figure 1 shows a plan of it and Figure 2 a section and elevation. The main wire *a* is bound by the screw *b* to a plate *c* which connects with the corrugated copper band *d*, lining the socket of the wooden plug *e*, around which is another band having corresponding screw threads fitting into the other, serving both to transmit the current and to hold the plug in place. To the copper band surrounding the plug is soldered the lead

FIG. 2.—SECTION AND ELEVATION OF CUT-OUT FOR FLOOR MAINS, WITH BRANCH CONNECTIONS.

wire *f*, forming the "safety-catch," passing down through the plug and soldered to a copper cup *g*, which (when the plug is screwed down) is pressed against the brass plate *h*, to an arm of which is bound the branch wire *k* by the screw *i*. The return wire is connected in the same way though a duplicate cut-out.

From the preceding general description of the methods employed in buildings of ordinary size, we now pass to the consideration of the system as applied to a very large building. We have chosen for this purpose the Mills' Building, where provision has been made for a greater number of electric lights (over 5,000) than in any other building in this city and probably greater than any other in the world. A brief notice of the

Digitized by Google

work, stating the amount of wire, etc., used, was given at the end of an article in THE SANITARY ENGINEER of August 10, 1882 (Vol. VI., page 203), on the plumbing of the building.

The Mills' Building is located on Broad street, at the corner of Exchange Place, which location is just outside the first district of the Edison Company, and in the second which includes the whole of the city south of Wall and Rector streets. As the plant of this district is not yet established, the actual lighting of the building is a thing of the future. The wiring was done while the building was in process of construction, which ended a few months ago. Though intended to be lighted from the central station like any other building in the district, it is possible that an isolated plant may be established for this alone, as has been done for several much smaller buildings in the city.

To show the method of distribution, a plan of one of the most "heavily" lighted floors (the eighth), is shown on page 53. This does not include the Wall street wing. The

FIG. 3.—COUPLING BY WHICH BRANCHES ARE TAKEN FROM THE VERTICAL MAINS.

central space marked "court" is open only above the first story, being roofed over at the second floor. The main entrance is through this covered court.

The main building (that part shown on the plan, being the whole except the Wall street wing), is divided into four sections by the court and the two halls at right angles to Broad street. The four sections are lighted separately from four vertical mains, one near the corner of each section. These vertical mains instead of being wires as in smaller buildings, are electric tubes like those used in the street. They are placed in hollow-brick flues and extend from the cellar to the eighth floor, decreasing in size as branches are taken off at each floor. The way in which the branches are connected to the main vertical tubes is shown in Figure 3, which also shows the appearance of the copper conductors projecting from the end of the wrought iron tube, and the millboard washers or diaphragms. Over each of these connecting couplings a tin water-shed is soldered around the pipe, to keep from the conductors any moisture coming down on the pipe.

Each of the four sections is subdivided on each floor into divisions embracing generally one suite of office-rooms with the fixtures in the hall alongside these rooms. On the floor shown in the plan, most of the suites consist of a large room containing a chandelier and from two to seven side lights, and two smaller rooms containing from two to four side lights. As many wires are taken from each vertical main at every floor as there are divisions in its section. Provision is made for cutting out the whole section by a cut-out placed in a pocket under the floor close to each vertical main (which will be found marked on the large plan near the front or bottom). A plan of this cut-out is shown in Figure 4. The wire *a* passing under the front of the block, comes up through a hole and is bent forward and fastened down by a binding screw to

FIG. 4.—MAIN CUT-OUT CLOSE TO VERTICAL TUBES.

the brass plate *b*, from which to the corresponding plate *d* on the other side the current passes through the lead wires or link *c*, thence out through *e*. Both poles are thus "cut" on the same block, as shown. Each line has also a "division cut-out" for every division, of a form similar to the "wall cut-out" shown in the first part of the article. These are also in pockets in the floor, a little removed from the main line in most cases (as shown in the plan), to bring the pockets in the corner of the room where they would be more accessible on account of carpets, etc. Each fixture is provided with a single pole "wall cut-out" as in ordinary work. The sizes of the fusible lead wires constituting the "safety-catches" in the cut-outs are so adjusted that no more lights will be put out when a catch fuses than is necessary; for instance, if the obstruction is between a wall cut-out and a division cut-out, the latter would burn out (before the main section cut-out) and only that division be cut off.

The horizontal lines are carried under the floor in wooden boxing except under tile floors, as the halls, where either electric tubing is used or lead pipe. The latter is used under the floor of the court in the basement, each wire being heavily taped (outside the regular insulation), and put in a separate pipe, which is also taped on the outside and buried in the cement. Zinc tubes are used for connection with the side fixtures.

The Wall street wing makes a fifth section, which is supplied from a fifth vertical main in a similar manner.

DRAINAGE AND VENTILATION OF HOUSES.

The following is an abstract of a paper read by Mr. Rogers Field, Nov. 17, before the Society of Medical Officers of Health, London:

Three sanitary principles govern house drainage. These are:

First.—All refuse matter must be completely and rapidly removed from the house.

Second.—There must never be any passage of air from the drains or waste pipes into the house.

Third.—There must be no connection between the drains and the domestic water supply.

These, although so simple, are very frequently neglected. The first goes absolutely to the root of sanitation, for were it strictly complied with there would be no leaky drains, no polluted sub-soil and no production of foul gases in the drains from decomposing organic matter. There cannot be a greater mistake than to assume, as is commonly done in investigating drainage, that if water runs away with freedom this is all that is required. Numerous cases are on record where the sewage from houses has apparently run away freely for years, but where the greater portion of it has really been leaking out of the drains into the ground under or close to the house.

In illustration of this point the author quoted two cases in his own practice, one in which the connection with the sewer was actually found to be blocked with shavings which had been left in when the house was built three years before; the other that of a school in which the drainage from the lavatories had leaked through disused drains under the floor of a large portion of the building, and although there was a mass of filth in some places seven feet deep, no leakage had been suspected.

If the drains are exposed and found clean and jointed with cement, this is not sufficient; the tops of the joints may be good and the bottoms bad. The only safe method is to actually test the drains by plugging them at the lower end and filling them with water; very few house drains indeed stand this test.

Even if the drains are outside the house, it is a mistake to assume that it is unimportant whether they are sound or not. Not only may sewage leak out of faulty joints and percolate under the house, but foul air may be drawn into the house.

It is important to realize how small an amount of deposit will create mischief by decomposing and generating foul gases; a mere irregularity of the joints, even when the drain has a good fall, is sufficient to cause this. There is no better test of the condition of the drains than the amount of smell emitted from a ventilating opening, for if drains be properly laid and in thorough working order practically no smell should exist.

The householder should guard against trusting too much to those parts of the drainage of a house which are visible, as an index of the condition of other and important parts which are concealed. An instance was mentioned of a house, the drainage of which had been recently reconstructed, and where all the sanitary arrangements

Digitized by Google

appeared at first sight to be perfect, but where a subsequent examination of the drains which were under the house showed that the joints were in many places defective and at one point the pipes were not jointed at all, but a space left large enough to put a hand in. Old drains which had no outlet connected were found beneath the passages and rooms; the housemaid nearly died of typhoid fever, and beneath the room she occupied was found an old drain with a large amount of foul deposit.

In another house a lady and her cook were attacked with erysipelas and blood-poisoning shortly after occupying it. Various alterations were made in the drainage, in the absence of the family, but, on their return, the lady was again attacked with erysipelas, and shortly after other members of the household. Again alterations were made and again the lady and the housemaid were attacked. An examination of the house showed that an old stoneware drain in the scullery, into which the sink formerly discharged, had not been removed, and though stopped with cement was imperfectly closed, allowing the air of the drain to enter the house.

The curious and unexpected paths drain air may sometimes take were discussed by Mr. Field. It had been known to pass along bell wire tubes, the proximity of the bell pull to the fireplace giving an increased opportunity for air to be drawn by the suction of the fire from a distance to this part of a room. Channels for gas pipes and for hot water pipes also not uncommonly give facility for the admission of foul air. A remarkable case was given, where the occupants of a particular bed in a school were constantly the subjects of slight attacks of pneumonia with tendency to typhoid. In this case the foul air was conducted from a lavatory, where there was defective drainage, up a staircase, and impinging on the ceiling of the dormitory was reflected on to the bed where the sickness occurred. The cause of the Duchess of Connaught's recent illness was found in defective drainage. Numerous experiments on the means by which the foul air entered the Duchess' bedroom showed that it was only when occupying certain positions in the room, that she would be exposed to the influence of the foul air, while in bed she would escape. As a matter of fact in twenty four hours after sitting on a sofa in one of these exposed positions, symptoms fully developed themselves.

In conclusion, the necessity of thorough separation between the domestic water supply and the drains was insisted upon.

A CONTAMINATED WELL.

The Concord, N. H., *Daily Monitor* recently contained an article on the pollution of the water of a well in the State House Yard, to which a case of typhoid fever had been attributed. The water of the well had been analyzed by Dr. I. A. Watson, and found to be dangerously contaminated with organic matters. It was, however, bright and cold, and had a good deal of popularity on that account. The case seemed sufficiently interesting to obtain a fuller statement from Dr. Watson, who is Secretary of the New Hampshire State Board of Health, and in response to a request from us we have received the following letter and illustration:

STATE OF NEW HAMPSHIRE.
OFFICE OF STATE BOARD OF HEALTH,
STATE HOUSE, CONCORD, *Dec.* 12, 1882.

To the Editor of THE SANITARY ENGINEER:

Your favor asking for further particulars regarding our State House, in addition to the item which you clip from the Concord *Daily Monitor*, is at hand.

The item is correct in every particular. The dangerous character of the well was exhibited by the very large amount of chlorides and nitrates that were developed by chemical reaction. In the waters of this locality no chlorine is to be found, except from contamination, and the very abundant amount that the water of this well contained left no doubt that sewerage pollution was its source.

The sketch indicates the relative position of the well to suspected sources of contamination, 1 being the State House well, and 2 a large tenement block; [] [] are residences. The dotted line with arrow head indicates the general direction of soil drainage in the immediate locality. The distance from the well (No. 1), to the nearest building (No. 2) is about 125 feet. This particular block has a population from 50 to 80 persons, and the sanitary conditions are such as to indicate that the well might readily be contaminated from it. How long this condition of the well may have existed is uncertain, as no analysis has before been made, that I am aware of. The case of typhoid mentioned in the article quoted terminated fatally, and I am informed that the deceased used only water from this well for drinking purposes. Subsequently, I have examined a sample of water from two wells in other and different localities in this city, and found them dangerously polluted. How any other result could be expected in a city as old as this, having had a system of sewers only a very few years, is beyond my

comprehension; yet there are those who would drink out of the pool of Siloam, rather than draw their pocket books for even a very inconsiderate amount.

Yours, etc., IRVING A. WATSON.

THE SANITARY ASSOCIATION OF NEW JERSEY.

The Sanitary Association of New Jersey held its eighth annual meeting at Trenton, the 14th and 15th of December. Among the gentlemen present, who are well known for their interest in various directions of sanitary work in New Jersey, were Dr. E. M. Hunt, President of the National Board of Health; Prof. A. R. Leeds, of the Stevens Institute of Technology; Profs. MacMillan and Libbey of Princeton; Mr. J. A. Adams, C. E., of Brooklyn; Mr. J. C. Bayles, editor of the *Iron Age;* Dr. Henry Mitchell, of Asbury Park; Mr. E. C. Dunn, of Newark, and others. Prof. J. Madison Watson, President of the Association, presided.

The first paper was by Prof. MacMillan on the "Disposal of Sewage in Inland Towns and Places."

The water carriage system on a large scale and under proper conditions is undoubtedly the least expensive. Easy access to a large body of water which shall carry the sewage discharged out beyond the limits of the town is the essential condition for this system. When it exists the speaker was of the opinion that even small settlements would find it more satisfactory in every way than the expedients they usually adopt. He concluded that fresh water streams have the power of destroying organic impurities which are mixed with them, and it is not therefore necessarily unsafe to cast sewage into streams of potable water. The capacity of any particular stream to effect such destruction depends on the degree of dilution of the foul matters; on the original purity of the stream and the degree of disturbance of its current, as bearing on its oxidizing powers; on the climate, the character of the soil on the bed of the stream, and on the presence of aquatic plants; and, finally, on the time of exposure of the putrescible matters to their reducing agencies.

Mr. Bayles followed with a paper on "The Problem of Drainage of Inland Towns." In illustration of what he considered the best system he described that of Birmingham and the Saltley Sewage Farm, with which our readers are already familiar. The evening session was devoted to the annual address by Prof. Watson, and to the reading of a paper on "The Disposal of Sewage in Cities" by Mr. J. A. Adams, C. E., with a discussion.

At the second day's session, after the reading of the annual report by the Corresponding Secretary, Dr. E. M. Hunt, the subject of "Adulteration of Foods, Drinks and Illuminating Oils" was brought forward. Prof. Cornwall, who was to have treated the subject, was absent, and it was discussed by Prof. Leeds. Power was required to punish persons guilty of adulteration, and unless that power were given, he feared the trouble incurred in detecting impurities would not be repaid. In the samples of mustard that he had examined, the purest kind contained 81 per cent. of mustard, and the poorest only 9 per cent., and 91 per cent. of something else. His report had been that the purest mustard was not absolutely pure. Naturally the manufacturer was aggrieved at this state of things. Upon making an examination of the works where that brand was made he found that a certain amount of the oil was extracted, which accounted for the deficiency. The extraction of the oil was made to prevent the mustard becoming rancid.

Prof. Leeds had prepared a table showing the nutritious properties of some of the many preparations sold for the use of children as food for infants. His conclusion was that the nearer the preparations conformed to nature's pattern the better.

Following Prof. Leeds' paper, the convention entered into a discussion of Prof. McMillan's paper of the previous day, after which Dr. E. L. B. Godfrey, of Camden, read a paper on the sources of humanized and bovine virus. He concluded that lymph should be propagated from animals of acknowledged health and quality, and State Legislatures should encourage the propagation of bovine virus for gratuitous distribution.

Dr. David Warman read a paper on revaccination, in which he reached the conclusion that in point of protective power bovine lymph is superior to humanized virus. Humanized virus, but a few removes from its bovine origin, is little inferior to it in efficiency, but continually transmitting it through the human system is a cause of gradual and certain deterioration. He recommended that the State of New Jersey should maintain a vaccine farm for the protection of the whole State.

A discussion on the adulteration of food followed, and then a paper was read by Rev. F. R. Brace on "What is feasible as to method and law for the protection of schools from uncleanliness and contagious diseases?" Prof H. B. Peirce, of New Brunswick, discussing the question of health in the public schools, submitted a number of resolutions concerning the management of schools in cases of contagious diseases appearing in them; the length of the school year, the daily session, etc.

The rest of the session was devoted to discussions of reports, after which the convention adjourned.

The following are the officers for the ensuing year: President, J. C. Bayles, C E.; Vice-Presidents, Dr. F. Gaunt, and Dr. L. Dennis; Recording Secretary, Dr. Henry Mitchell; Corresponding Secretary, J. Madison Watson; Treasurer, Dr. W. K. Newton; Executive Council, Dr. C. F. W. Myers, Paterson; Prof. A. R. Leeds, Hoboken; Dr. D. Benjamin, Camden; L. B. Ward, C.E., Jersey City; Dr. E. M. Hunt, Trenton; R. Wescott, Elizabeth; Louis Derousse, Camden; Rev. W. Harris, Princeton; Prof. H. B. Peirce, New Brunswick; Dr. J. L. Bodine, Trenton; Martin Coryell, Lambertville; S. W. Elder, Hoboken.

PHILADELPHIA SEWERAGE

The *Medical News* makes the following sensible comments on the needs of Philadelphia:

"It is a well known fact that one of the chief causes of the foul condition of the sewers is the discharge into them of decomposing excreta and other organic matter. If house-sewage escaped in a fresh state, and sewers were properly constructed so as to insure the ready and quick removal of this matter before decomposition sets in, the evils most complained of would be averted.

"With regard to the plumbing arrangements of houses, there is nothing specially to report which is not common to almost all American cities. The best and the worst and all intermediate grades of work exist, as might be expected when the matter is left in the hands of the owners of property and mechanics. Owners, as a rule, have not the special sanitary knowledge required in designing and supervising the work; the mechanics can hardly be expected to execute the most skillful labor when their financial success depends so largely on the greatest economy in construction. Their lack of knowledge of the correct sanitary principles of house drainage, is also a very frequent cause of defective work. The remedy is found in the public regulation and supervision of house drainage. This plan has been applied with great benefit in Providence, R. I., and has also recently been inaugurated in New York city. The regulations adopted by New York Board of Health may be found in full in our issue of November, 1881.

"The evils which result from defects in plan and execution of house drainage, as exemplified by the methods pursued in Philadelphia, are to be remedied: *First.* By prohibitory laws with regard to cesspools and pits of every description. *Second.* By compulsory laws on the subject of sewer-construction where sewers exist; and in their absence, by the enforced adoption of the 'dry-removal' system. *Third.* By the systematic regulation and supervision by the civil authorities of the details of private drainage arrangements, and by periodical inspection by properly qualified public officers."

THE PROSECUTIONS UNDER THE FOOD AND DRUG LAW.

The grocers against whom the State Board of Health has commenced prosecution for selling adulterated cream of tartar, appeared at the Court of Special Sessions on Friday last, and asked for an adjournment. It was claimed by counsel for one of the defendents that the Penal Code repealed the law under which the cases were brought, but this was denied by the court.

It appears probable that the Grocers' Association, of which some of the defendants are members, will take some action in the matter. We also understand that the parties of whom the grocers purchased the adulterated goods will be called upon to defend their action.

John Bade, of 124 Canal street; Ernest Spanhoff, 19 Bayard street; and J. H. W. Doscher, 324 Broome street, have been held in $300 bail each to answer for selling adulterated cream of tartar.

OIL OF PENNYROYAL.

The Pharmacopœia states that this oil has a specific gravity "about 0.940." Ten samples recently examined had the following properties:

No.	*Color.*	*Specific Gravity.*	*Temp.*
1.	Light yellowish	0.93203	17 deg. C.
2.	" "	.92973	17 "
3.	" "	.92605	16 "
4.	" "	.92691	16 "
5.	Dark "	.91323	16 "
6.	Light "	.92193	17 "
7.	" "	.93619	16 "
8.	Nearly colorless	.93114	16 "
9.	Light yellowish	.94011	16 "
10.	" "	.93725	16 "

All dissolved clear in one-half volume of 91 per-cent. alcohol. Number eight was the finest specimen; number six contained a small amount of alcohol; four and five had an odor of turpentine, but whether this was due to intentional sophistication, or to decomposition of the oil is hard to tell.

The samples differed considerably in odor, several reminding one strongly of peppermint. The only one really free from any foreign odor was number eight.

MEDICATED SOAPS.—The *Seifenfabrikant* gives the following recipes for the manufacture of the above:

Tannin Soap.—Nine kilos. of coccanut oil are saponified with four and one-half kilos. of soda lye, then 250 grammes of tannin, which has been previously dissolved in spirits, are put in and mixed. The soap is perfumed with 30 grammes Peru balsam; 10 grammes cassia oil; 10 grammes oil of cloves.

Iodine Soap.—Ten kilos. cocoanut oil, five kilos. lye at 38° B., one and one-half kilos. of iodide of potassium, dissolved in one-half kilo. of water.

Gall Soap.—One and one-half kilos. of galls are stirred in 25 kilos. of melted cocoanut oil, and the latter then saponified cold with 22½ kilos. of soda lye at 38° B. The soap is colored with 350 grammes of ultramarine green, and perfumed with 75 grammes lavender oil, 75 grammes cummin oil.

Camphorated Sulphur Soap.—Twelve kilos. of cocoanut oil. six kilos. of soda lye of 38° B.; one kilo. of sulphate of potassium, dissolved in one-half kilo. of water; 160 grammes of camphor, which is to be dissolved in the melted cocoanut oil.—*Chem. and Drug. Oct.* 14, 1882.

Considerable cod liver oil of good quality is now produced at Swampscott, near Lynn, Massachusetts. This oil is used at the Massachusetts General Hospital, and is reputed to be equal to the best Norwegian.

In some experiments as to the conditions conducive to the action of pepsine, made by Herr A. Mayer (*Zeits. f. Biol.*, xvi., 351; *Mon. Scient.*, [3] xii., 842) it was found that the action was favored by elevation of temperature; the limit is, however, reached at 55° C., for between 55° and 60° the ferment is killed. Hydrochloric acid of a strength corresponding to two parts of acid in 1,000 was found best to promote the action. Other acids were tried and gave results corresponding with the following order:—nitric, oxalic, sulphuric, lactic, tartaric, formic, succinic, acetic, butyric, salicylic. The last two had no action. Coagulated albumen was the substance operated upon and the pepsine used was prepared by macerating the mucus from a pig's stomach with glycerine and precipitating with alcohol. The presence of bacteria did not in any way retard the action of the pepsine.—*Phar. Journal and Trans., Sept.* 30, 1882.

The *Medical News*, of Philadelphia, some time since, appointed a commission to examine and report on the composition of pharmaceutical preparations. In the issue of December 16 a report is published on two-grain quinine pills of seven different makers. The methods of assay is given together with the results obtained, which vary from 1.61 to 2.10 grains per pill. The general results of this investigation are stated to be:

"*First.* That the quinine pills of five out of seven of our leading manufacturers have not in them the amount of sulphate of quinine which they are represented to contain.

"*Second.* That there is a great variation in the price at which the pills can be purchased.

"*Third.* That the price bears no relation to the amount of quinine really contained in the pills."

In a future issue we shall print a communication on the methods of assay of quinine pills.

The New England Milk Producers' Association, at their meeting in Boston the 12th inst., decided to present a bill to the State Legislature this winter, regarding the adulteration of milk and its inspection, under the State's authority.

"Good morning, Mrs. Simpkins. I see that you haven't any milkman now." "No; Mr. Simpkins has made an arrangement with the water company, and we've got a hydrant in the house."—*Louisville Courier Journal.—Herald, Syracuse.*

Gas and Electricity.

Illuminating Power of Gas in New York City.

E. G. LOVE, Ph.D., *Gas Examiner.*

GAS PIPES IN THE STREETS.

We have already called attention to the ordinance passed by the Board of Aldermen in 1876, granting permission to any gas company to lay pipes in the streets of this city, subject, however, to conditions to be named by the gas commission. Under this ordinance a new company recently asked the commissioner to state the conditions under which it could lay pipes in the streets. Up to the present time no action has been taken in the matter. It appears that at the meeting of the aldermen on the 12th inst., the ordinance in question was rescinded, and if this action is approved by the Mayor it will make it impossible for any new gas company to use the streets of the city without special permission from the Board of Aldermen. At the same time it takes away the power of the gas commission to dictate the conditions under which the streets may be used.

It would probably be a matter of no great difficulty for a gas company to get permission from the Aldermen to tear up the streets for the purpose of laying gas mains, whether these mains were needed or not. It therefore seems to be a question of choosing the lesser of two evils: either rescind the ordinance and trust to the uncertain action of a Board of Aldermen to give unlimited power, or let the ordinance stand and depend upon the gas commission to name such conditions as shall make the work of a new company a benefit and not an evil to the public.

SHUTTING OFF GAS FROM BURNING BUILDINGS.

NEW YORK *Dec.* 11, 1882.

To the Editor of THE SANITARY ENGINEER:

DEAR SIR:—I have always noticed that at large fires the subsiding of the flames and the cooling of ruins are greatly retarded by great sheets of flames, issuing from the broken service pipes, which lead from the gas main in the street to the interior of the buildings.

In many cases, it is impossible to stop this flow of gas for several days after the fire, as it is necessary to dig down to the pipe, outside of the burned building, which is not readily done in winter, or when the streets are obstructed.

I would, therefore, make the following suggestion, which I think could be carried out. A stop cock should be put in every service pipe outside all buildings, to which access could be had by firemen, policemen or other proper persons, by means of locked plates in the sidewalks, and a rod protected by a pipe reaching to the stop cock. This would enable proper persons at the scene of a fire to cut off the gas whenever it seemed necessary.

The only way to cut off the gas from a building now, is to shut it off at the meter. This is seldom done, because meters are put in out of the way places, and even if it is done, the flow of gas is only stopped until the building burns down, and the meter pipes, which are of lead, are melted off the service pipes.

If gas companies would adopt this plan, or something to that effect, much labor would be saved. It would enable the firemen to cool the ruins with less water, and when bodies are buried in the debris, search for them could be made sooner than at present.

Respectfully yours, EMIL H. KOSMAK,
13 and 15 Chatham street.

[The suggestion of our correspondent, who is a member of the Fire Department of this city, is entitled to consideration. There are a few cities which yet rely on stop cocks below the sidewalk to shut the gas off from a burning building. Experience, however, has shown that in most cases after a fire has broken out, the stop cock cannot be easily got at, because the box is filled with dirt and rubbish, and in spite of its existence, the street must be dug up in order to cut off the supply of gas. This experience, we believe, has induced many companies to rely on digging up the streets when they wish to cut off the gas from a burning building.]

THE EARLY USE OF COAL IN ENGLAND.

About the beginning of the thirteenth century, much objection was raised against the introduction of coal into London on the plea that its smoke was an intolerable nuisance. This opposition was continued for nearly two hundred years in some quarters, but was at last obliged to give way before the growing necessity of timber. Toward the beginning of the fourteenth century, many shallow collieries were opened out in the neighborhood of Newcastle-on-Tyne, but little is known about the progress of the use of coal during the course of the fifteenth century. There is enough to show, however, that the demand for coal went on increasing. In a petition presented to the council by the Company of Brewers in 1578, we find that corporation offering to use wood only in the neighborhood of Westminster Palace, as they understand that the queen findeth "hersealfe greatley greved and anoyed with the taste and smell of the sea cooles." Another author, writing in 1631, says that "within thirty years last the nice dames of London would not come into any house or room when sea coals were burned, nor willingly eat of the meat that was either sod or roasted with sea-coal fire." Soon after the commencement of the seventeenth century, the use of coal for domestic purposes, as well as for washing, brewing, dyeing, etc., was general and complete. The mines were still shallow, and they were drained by means of horizontal tunnels called adits, water-gates, etc. Already attempts had been made to sink some of them under the water level and to raise the water by machinery. In the year 1486–87, the monks of Finchdale Priory expended a sum of money at one of their collieries on the Wear "on the new ordinance of the pump," and on the purchase of horses to work it. Underground fires and noxious gases began also to appear about this time. The miners' tools consisted of a pick, a hammer, a wedge, and a wooden shovel. The coal was raised to the surface in some cases by means of a windlass; in others, as in the mines of east Scotland, it was carried up stairs on the backs of women called coal-bearers. In the year 1615, the fleet of vessels called the coal fleet, which carried the produce of the northern collieries—one-half to London, the remainder to other destinations—numbered 400 sail. Many foreign vessels also, especially French, carried away cargoes of coal to their respective countries. Twenty years later, the coal fleet had increased to 600 or 700 sail, and was already regarded as "a great nursery of seamen."—*Engineering and Mining Journal.*

ELECTRIC LIGHT NOTES.

The electric light has excited the alarm of the chief local magistrate of Shanghai, who declares that its introduction into the foreign quarter of the city will be followed by total destruction.

The need of electric lamps along the water front of Philadelphia to enable the unloading of vessels to be performed with more facility, and to afford protection against thieves, has induced the Philadelphia Councils Committee to confer with the Brush Company about the cost of supplying lamps. Some members of the committee prefer to open the supplying of the lamps to general competition, rather than to awarding the contract immediately to the Brush Company.

Meter-ites.

By a vote of eight to two, the Jersey city Aldermen have decided to grant a charter to a new gas company, which is expected to furnish gas for $1.50 per 1,000 cubic feet.

Waterbury, Ct., has come to the conclusion that it had better make a contract with one of the gas companies. No electric light company has yet been formed there.

The Boston Gas Light Company propose to reduce the price of gas to $1.80 per thousand feet from and after January 1. This is a sensible move, and if the New York companies are wise they will do the same thing.

The town of New Lots has made a ten year contract with the Empire Gas Company of Brooklyn to furnish gas to the town and to private consumers at $25 per lamp to the city, and $2.50 per 1,000 cubic feet to private consumers. When private consumption reaches 30,000 cubic feet per day the price will be lowered to $20 per lamp and $2.25 per 1,000 cubic feet.

The City Engineer of Hamilton, Ontario, Mr. William Haskins, has recommended to the City Council that arrangements be made for ventilating the sewers by manholes with grated covers. The *Evening Times* of that city thereupon devotes a column to a dissertation on ventilation of sewers, and suggests a plan which it considers "theoretically nearly perfect," but admits that it has never seen it in use. It consists in attaching to the furnace or stove which heats a house, a tight iron chamber of about a cubic foot capacity, and leading a 2-inch iron pipe from the house drain to this chamber, and another from the chamber to the chimney flues. The working of this arrangement is supposed to be as follows:

"When the fire is lighted, the air in the cubical chamber becomes heated and passes off to the flue, leaving a vacuum, to which the foul air is drawn from the sewer pipe. The heat kills all disease germs, and the foul air, greatly rarefied, passes off through the flue. The draught is downward from the sinks, closets, roof ventilator, etc., instead of upward, and no sewer gas can go into the rooms."

Here is the old idea again, that the movement of air in a long system of pipes can be controlled by heating a little piece of the pipe. It does not work satisfactory, and it cannot be made to. Then the introduction of all the extra joints and fittings into a house, which such an arrangement would require, and compelling all the foul air from the drains to enter and pass through the house in going from the drain to the chimney, would add to the chances of pollution of the air of the house from leaky joints, especially as the pipes would be subject to great change of temperature. To be sure, the *Times* thinks it has provided for all contingencies by suggesting that "when the fire goes out, the ordinary arrangement of traps and ventilators come into play, and in summer the connection of the iron chamber with the sewer could be cut off by a stop-cock," but then who is to be detailed to man the stop-cock?

The writer seems to have more regard for the business interest of the foundries, which he says are plentiful in Hamilton, than for the sanitary condition of the citizens.

He concludes by saying: "We commend this idea to stove and furnace manufacturers, who might make a profitable business out of it, now that so large a proportion of the houses in the city are connected with sewers."

Our advice both to manufacturers and consumers of stoves would be, to let such jimcracks alone, and provide no more inlets for bad air into their rooms than can possibly be avoided, and to furnish the sewers and drains with as many outlets to the external air as can be afforded.

Correspondence.

EXPANSION TANKS.

KANSAS CITY, MO., *Dec.* 6, 1882.

To the Editor of THE SANITARY ENGINEER:

I wish through your columns to make a few inquiries about hot water heaters, as to location of expansion tanks and hot water apparatus. I have had discussions on several occasions about their location. When I have my way on open jobs I place the tank at boiler and exhaust the air at ends, and I claim that when the job is running I get a more rapid circulation than if the tank is on end of job; that is, I get a direct return, while with tank at end it is lazy and hot water in tank evaporates, and the tank is always the hottest part of the job. Another advantage is that I can, with one tank, do what others require several for. One tank at boiler does the work of several at ends, either in closed or open jobs. I do not want it understood that I am asking for any instructions; all I wish to get is opinions as to efficiency. The idea is this, does a hot water apparatus circulate more rapidly when ends are closed than when they are open? I know about steam vapor, etc., at ends, and dispensing with those objections as I can do, I wish to get at facts regarding rapidity of circulation in either case. Hoping to hear from you in this matter, I am yours respectfully,

THOMAS H. WALKER.

[We can hardly make your statements of the case agree with each other. For instance, you say in speaking of the circulation "with tank at end it is lazy, and the hot water in the tank evaporates and *the tank is always the hottest part of the job.*" Now if the tank is the "hottest," the circulation between the tank and boiler must be rapid to make it so, and consequently is not lazy.

In reality, the location of the "tank" depends entirely on the arrangement of the work. If you rise from the boiler to the farther end of the circulation, the tank should be located at the farther end, for two reasons: you get a better circulation, and also relieve the circulation from air or vapor at the highest point, and it is this vapor and air which makes the circulation more rapid because it is lighter. This vapor, or air, or both, on account of being lighter than the water, naturally seeks the upper level, and in its efforts to reach it pushes or accelerates the speed of the water in its travel to reach the highest point. This principle is very finely illustrated in a patent clothes boiler which was very much in use in some parts of the country several years since, and was constructed as follows:

B is a common stove boiler; *C*, perforated false bottom resting on supports about two inches above the bottom of the boiler, and having two tapering tubes, *D*, *D*, bent at the top and opening underneath and fastened to the false bottom.

Now when this boiler is filled with clothes and water up to the water line *E*, the vapor generated below the false bottom carries the water above the water line through the tubes and forms a circulation, the water sinking back through the perforations to be again carried through the tubes. The more vapor generated, the more rapid the circulation.]

WHAT BURSTS THE PIPE?

NEWARK, N. J., *Dec.* 11, 1882.

To the Editor of THE SANITARY ENGINEER:

Will you be kind enough to inform me in the next edition of your esteemed paper what causes the bursting of lead pipe, the freezing, or the thawing? and oblige one of your subscribers. A. J. S.

[The bursting is caused by the freezing of the water, which, when formed into ice, is increased in bulk. The fact of the burst in the pipe is, however, only made manifest when the ice begins to melt.]

LEAD-LINED TANKS.

SING SING, N. Y., *Nov.* 30, 1882.

To the Editor of THE SANITARY ENGINEER:

Enclosed you will find a portion of a substance which formed in a sheet lead tank, lined by me about six weeks ago. This tank is fed by rain water taken from a shingle roof, and why oxidization to such an extent and in such a short time should take place is something unusual to me.

This substance has formed a coating, completely covering the sides and leaving a sediment on the bottom of the tank about half an inch deep.

I have had the tank cleaned out and painted with white lead paint. I was advised as to which would be the best, lead paint or shellac varnish, but I was afraid the latter would not stand the test of being exposed to water and air alternately.

By letting me know what this substance is, and why it should form in such a short time, you will greatly oblige.

Yours truly, R. L.

[The substance in question consists of carbonate of lead. Its amount is very excessive and shows that the water must have been heavily charged with carbonic acid or carbonates.]

SETTING HOPPERS.

NEW YORK, *Dec.* 5, 1882.

To the Editor of THE SANITARY ENGINEER:

In my judgment the best way to set a hopper on a marble floor is to countersink the marble, so that the lead flange will be flush with the floor. The lead surface should then be covered with white lead, and also the stem of the hopper that enters the opening. If there are screw-holes in the hopper flange, small brass bolts, of the same pattern as a basin clamp bolt, should be caulked into the marble with molten lead in such a way that the bolts will pass through the screw holes, and then the hopper to be fastened down with suitable nuts; but if there are no screw holes in the flange, then the bolts should be set outside the flange, but close up to it. In this case basin clamps would serve the purpose as well as anything I know of. The hopper may be set with common cement or plaster. Yours, J. M., JR.

THE VALUE OF EARTH CLOSET MANURE.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE,
HAMPTON, VA., *Dec.* 11, 1882.

To the Editor of THE SANITARY ENGINEER:

Will you kindly give me the opinion of the best authorities on the value of earth closet refuse for manurial purposes? We are taking a good deal of trouble to cart it off for our farm, and the wisdom of this is questioned.

Yours very truly, S. C. ARMSTRONG.

[You should apply to the editor of the *Country Gentleman* for this information. It would be interesting to have General Armstrong's opinion, based on his own experience, as to whether it is cheaper to buy manure or collect it in the way he is doing.]

TAKING RETURN BELOW BOILER.

The following letter from Mr. Tucker, of Boston, was received some months ago, and was at once referred to a gentleman who is an authority on questions connected with boilers. Owing to his numerous professional engagements, a reply was delayed, but we now publish it with a comment, as we think it will interest all our readers who regard the theory of boiler circulation as important. Some may wish to follow the correspondence from its beginning, and note the various opinions which practical men have expressed about the feasibility of securing circulation below the boiler or water-back. We would direct them to the following pages of the SANITARY ENGINEER, Vol. V., pp. 80, 121, 182, 326. Vol. VI., p. 85.

To the Editor of THE SANITARY ENGINEER:

In your 5th Vol., page 80, you published a cut at the request of Mr. W. W. Coleman. After reading your opinion thereon I made up my mind that you inadvertently omitted to inform Mr. C. that although the circulation would work well, he could not draw hot water at wash bowl, first story, and wrote you accordingly, which you were kind enough to publish in the same volume, page 182.

This letter was followed by a revised cut showing the proper way to supply the bowl through the added pipe *A*.

In your remarks following my letter, although a virtual admission was made that only a little hot water could be drawn at the bowl, and that from the bottom of the boiler, yet you say, Vol. VI., page 85, that B. made a fair point on T.

Now if THE SANITARY ENGINEER is willing to assert as correct the doctrine put forward by B., that an established circulation cannot be arrested by opening the tap at bowl, as shown in the first cut, and that hot water will run through it from top of boiler when the distance from this tap to boiler, by way of the return, is shorter than it would be from the top, I will have no more to say further than I am inclined to think you will not be sustained in your theory. Respectfully, J. T.

[The *point* on which Mr. Coleman asked information, Vol. V., page 80, was whether a circulating pipe below the level of the hot water boiler would or would not operate, Mr. Coleman contending that it would, while his plumber insisted that it would not.

We pronounced the plumber wrong. On page 182, Vol. V., you assume that we "inadvertently omitted to inform Mr. Coleman that *he will not be able*, with his system of circulation, *to draw hot water at wash bowl, first story*, since *water (cold) can only be had there from the bottom of the boiler*," etc.

This was a *point* introduced by you, as we supposed, to draw attention to the fact that the way shown (in the first sketch) was not the proper manner in which to supply the first story bowl with hot water. We accordingly, so

Digitized by Google

that no one might be misled, introduced the second sketch, showing the proper way to supply the bowl with hot water. At the same time we contended that, under *certain conditions*, hot water could be drawn at the wash bowl, and under these conditions we stated you could draw nothing but hot water. Now, do not mistake what these conditions are—"if the entire contents of the boiler are heated you cannot fail to draw hot water at the basin till such time," etc.

Now as to the communication of B., Vol. VI., page 85, to which you refer. We think you overlook the *point* that B. is contending for, viz.: that hot water "under some conditions" (and he very clearly states the conditions) can be drawn at the bowl first story.

We have carefully re-read B.'s letter and fail to find in it the idea which you seem to convey that "the doctrine put forward by B. is that an established circulation cannot be arrested." We can find no "doctrine" of this kind mentioned or even intimated. Neither can we find where a "virtual admission was made that only a little hot water could be drawn at the bowl and that from the bottom of the boiler." What we did say was when "water enough was drawn to displace the heated water below the return pipe," etc., and this does not intimate from which direction the hot water would flow, but we will now say that if the cold water supply to the boiler is of twice the capacity of the hot water or circulating pipe, and a faucet, also of twice the size of the hot water pipe (no matter where located on the line) be opened wide, the water will flow from the boiler through both the hot water and the circulating or return pipe to the open faucet, and this statement does not necessarily controvert that of B., wherein he says "opening the faucet simply allows a *portion* of this movement or circulation to vent itself out of the faucet."

There is, though, a statement in the last clause of B.'s communication, wherein he states, "Of course the pipe might be put so far down that no circulation would take place," which is not thoroughly explained.

The query would naturally arise, if the statement be true: How far below the boiler can the return pipe be placed and work? If it will operate at three feet below the boiler, why will it not, on the *same principle*, operate at six, ten, or twenty or fifty feet below? If the hot water pipe rise as far above the boiler as the return descends below, what is to hinder it from working?

There is also a *point* in J. T.'s letter, Vol. V., page 182, which some may question, "as the distance, according to the cut, is much shorter from the bowl to the boiler by way of the return pipe than through the hot water pipe." Now leave out the pipe *A*, as shown. Is not the distance of the hot water in the pipe directly over the bowl much less than "to the boiler by way of the return pipe?" Is not also the current travelling to the boiler by way of the return?

If distance were the only point to consider, the hot water would seem to have the best chance of success, as it is already on its travel toward the bowl, while the cold water to reach it must stop the established current and make the longer distance.]

AMOUNT OF RADIATING SURFACE.

MONTREAL, *Nov.* 30, 1882.

To the Editor of THE SANITARY ENGINEER:

How many feet of one-inch steam pipe radiating surface of the Nason form of radiator, will it take to give a temperature of 140° Fah.; the room is 26 feet 6 inches long, 15 feet 4 inches wide and 14 feet high; one side and one end exposed to the outer air, other side and end abutting on well-warmed rooms, walls of eight-inch brick, lathed and plastered on the inside; three windows, each 7 ft. 4 in. wide, fitted with double sashes. In the room sunk below floor is a plunge bath 16 ft. x 8 ft. x 5 deep. This will usually be full of cold water; sides of tank and floor are tiled. Steam pressure on boiler 10 pounds, fitted to work as a gravity apparatus.

Yours, J. W. HUGHES.

[If you use long, flat radiators (single or double rows) and place them on the outside walls, 200 Nason radiator tubes is about what would be required. There might be conditions which would raise the surface to 250 square feet, and then again with great precaution, such as drawing down window shades and closing some of the inside blinds, a test might be conducted which would give the required temperature with only 170 square feet. This does not take into consideration the effect caused by the plunge bath, and we think nothing but experiment will determine the extra surface required. It may be that the evaporation from the surface of the bath will require much extra heat, and then again if there is no ventilation the air may become heavily charged with moisture when a very small addition of surface will prove sufficient.]

LEAD BURNING.

PHILADELPHIA, PA., *Dec.* 7, 1882.

To the Editor of THE SANITARY ENGINEER:

I write to get from you, if possible, information as to the simplest and best lead burning machine, and the price of same. You will confer a great favor by sending an immediate answer. Yours respectfully,

JOHN WORTHINGTON.

[We understand an improved apparatus for lead burning has been devised by Mr. Thomas Walker, of Kansas City, Mo. His street address is No. 1310 Baltimore avenue.]

WET AND DRY COAL IN MAKING STEAM.

The New York *Tribune* states that a series of tests was made recently at Bochum, Germany, to determine the value of wet and dry bituminous coal in the making of steam. Washed slack, holding 18 per cent. of water and 9.9 per cent. of ash, evaporated 5.7 pounds of water per pound of fuel; while the same coal, with only 3 per cent. of water, made from 8 to 8.5 pounds of steam. Making due allowance for moisture by reducing to a standard of like quantities of coal, free from moisture, there is found to be a direct loss by using wet coal, of 14 per cent.

[Engineers who turn the hose on the coal heap to *make it burn better*, should consider well the above. If you reason with them they cite the custom of a blacksmith in wetting his coal to get a heat. The blacksmith wets his coal to coke it, and to make his fire solid, so as to direct the blast as he requires. A few of them have the idea they are burning *hydrogen* by so doing; but the intelligent men to-day know better.

We think, also, it would be well for the New York coal dealer to read the above and cover his coal in the yard, and not tell his customer, "The rain (water) improves the coal and makes the fire hotter."

To our own knowledge a ton of nut coal is capable of taking up 300 pounds of water, and even should we admit the coal dealer's argument to be true, we still think it would be better for the customer to get his coal dry and wet it himself.]

THE YONKERS NUISANCE.

The people of Yonkers, N. Y., appear to have become restive at last, under the neglect of the Governor to act on the report of the State Board of Health, with respect to the pestilent nuisance which exists in the heart of that thriving city. The *Statesman* wants to know "who is resposible for the apparent trifling with great interests, the State Board of Health, or Governor Cornell? The people who foot the bills, and suffer from ever threatening nuisances, ought to know."

So far as we are able to judge from the records of the proceedings in the matter of the Nepperhan nuisance, the tax payers of Yonkers are primarily to blame for the existence and continuance of this foul blot upon their city. Secondarily the Governor is to blame for not making an effort at least to compel the officers elected by the people to do their duty, and relieve their constituents of the discomfort and danger to which they are exposed.

The case is plain, and the responsibility cannot be shifted from the shoulders of the Aldermen and Health Board of Yonkers. The Board of Aldermen consists of eight members. Four of them have persistently refused to take the action which has been urged upon them by the Sewer Commissioners and approved by the other four Aldermen. On those four unreasonable and obstinate men will lie the guilt of the disease and death which are likely at any time to visit the dwellers on the lower part of the course of the Nepperhan River in its passage through Yonkers. This stream draining twenty-five square miles of rural country, and liable to extreme variations of flow, sometimes a mere rivulet, sometimes a raging torrent, enters the city of Yonkers pure. It leaves it, or more properly it stays along the last quarter of a mile of its course and the dock front on the Hudson River, a nasty stinking pool, charged with sewage from 6,000 people and the filthy suds and dye stuffs from the scouring and manufacture of about 10,000 pounds of wool daily.

There are over fifty houses and shops in the centre of the town, bordering on and directly over this stream, the filth and garbage from which are deposited directly in the stream, or when the water is low, lie stinking on its banks.

The Water Board, which is charged by law with the planning and construction of sewers, has long ago prepared plans for the thorough sewage of this district and asked the Board of Aldermen for authority to take the only step which can relieve the nuisance, the construction of sewers in the streets adjacent to the stream and the compelling of the inhabitants to make connection with those sewers. The four Aldermen refuse to do this. The reason for their action is stated to be that certain of their constituents are averse to being assessed for the cost of the sewers and think that the nuisance could be abated by making the stream nothing but a sewer and removing the half dozen dams which now give it a commercial value.

To support their views, they engaged the services of one of the most prominent hydraulic engineers in the country. His report showed that the cost of their idea would be enormous. So they simply fell back on their dog-in the-manger policy, and refused to do anything to save the dwellers within smelling distance of the foul stream from the sickening stench which it gives forth.

The City Board of Health, which is a composite body, made up of heads of different departments, appealed to the Governor, and he directed the State Board of Health to examine into the matter. They did so promptly, and on September ninth made their report to the Governor, recommending that he use every means in his power to cause the prompt abatement of the nuisance on the general plan which had been already laid out by the Water Commissioners. There the report still lies. Three months have elapsed and the Governor has made no sign. It has been rumored that there was doubt as to his constitutional power to order municipal authorities to exercise their charter powers in a specific manner.

The law directs that the Governor shall prescribe the manner in which a nuisance shall be abated, and the charter of the city directs which of the city officers shall perform certain functions. The constitutionality of an act was never tested by inaction. If the Governor has the power he should exercise it, in so plain a case as this. If he has not the necessary power, the sooner it is known the better, so that the law may be amended.

But pending the action of the Governor, the City authorities refuse or neglect to take any steps to help the citizens, although it is well-known that the recommendations of the State Board of Health were in accord with those of all the engineers who have examined the matter, and the opinion of the Water Commissioners.

If the Governor will not act, and the city authorities neglect to perform their manifest duty, we do not see that there is anything for the citizens of Yonkers to do, except to wait for the next charter election and then see to it that men with some sense of responsibility are put in office. Or possibly the new Governor who is familiar with nuisances in his own home, may be induced to take more interest in the matter than does the present one.

Whatever the result, several months of time of exceeding value for preparation for prompt and vigorous action in the spring, have been frittered away.

ERRATUM.

NEW YORK CITY, *Dec.* 15, 1882.

To the Editor of THE SANITARY ENGINEER:

In the last "Thermus" article, page 29, second column, near the top, it should read, "A pound weight of steam having very nearly the same heating properties, whether the pressure is one pound per square inch and with a bulk of (*sic*) 27 cubic feet, or fifty pounds per square inch with a bulk of—(*sic*) seven and one-third cubic feet."

Yours respectfully, "THERMUS."

Mr. H. C. Lowrie has been chosen City Engineer by the City Council of Denver, Col. The Denver *Republican* says his election will ensure an honest and capable administration in his department.

A correspondent complains to Dr. DeWolf, Health Officer of Chicago, that the ventilation of many school rooms, which are in basements of the public school buildings, or in unfit rented buildings, is so bad as to be dangerous to the school children. Dr. DeWolf admits that the complaint has foundation, but says the limited funds at command prevent the provision of fit accommodations. Even with such rooms as can be obtained, 20,000 children are out of school. Dr. DeWolf will make personal inspection of the schools, and recommend improvements in their ventilation.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

NOVELTIES IN PIPE-FITTERS' TOOLS.

The following are among the new inventions of James H. Lancaster which the Lancaster Manufacturing Company, of 95 and 97 Liberty street, this city, are about to put on the market.

FIGURE 1.

Figure 1 represents an adjustable pipe-guide to be attached to a new form of die-stock, and to take the place of the solid "bushings" now generally in use. The die-stock we have not space to illustrate, but the peculiar features are, the method of adjusting the dies by turning one of the handles (which arrangement also permits the removal of the tool without turning back on the threads), and the provision for removing the dies for exchange or the insertion in their place of a pipe cut-off. Though intended to accompany the new style of stock, the guide may be attached to other styles. It consists of a cylinder or short piece of tube, having a flange around its base, through which screws pass to hold it to the face of the stock body; and of three pairs of ears or lugs in the angle between the flange and the surface of cylinder, in which are pivoted the guides, which play through slots reaching nearly to the top of the cylinder; together with a ring-nut (with milled edges for turning it by the fingers), threaded to the outside of the cylinder, and moving along the upper half. This moves all the guide-arms in through the slots toward the axis of cylinder with equal rapidity as it moves down, and centres the pipe or rod passing between them.

Figure 2 shows a "twin" pipe cutter. The advantages claimed for it are a wide range of sizes, a rapid adjustment, a true movement of the wheel carriers in parallel guides, securing a uniform cutting effect, and the removal of the burr and tapering of the end of the pipe, leaving it ready for threading, at the same time with the cutting. The latter is accomplished by a double-bladed tool, pivoted in a slot in the centre of the body, opposite the wheel. The method of adjustment is plainly shown in the figure. For the larger sizes a double handle is provided, screwing into the other end of the body, so that two men may work to better advantage than with a single handle.

Figure 3 represents an inside burr reamer, the first thing of the kind, we are told, that has ever been made as an article of merchandise. Heretofore, shops requiring them have them made to order for their special use. It consists of a long conical body fitting a large range of sizes, in the surface of which are inserted, and held in place by screws, either one or three cutters. It is turned by an ordinary tap wrench, or a small rod or tube.

FIGURE 3.

FIGURE 2.

PLUMBING LAW VIOLATIONS.

During the week ending December 18, eight violations, more or less serious, of the plumbing law were reported to the Board of Health by Inspector Hooper, three by Inspector Hollick and two by Inspector Golden.

BROOKLYN PRIZE SCHOOL HOUSE PLANS.

The time for the reception of plans in competition for the prizes offered by Mayor Low, of Brooklyn, expired November 20, but owing to difficulty in getting together all the members of the committee of award, the result has not yet been announced. We understand the committee are to meet this week, and we hope to report their decision in our next issue.

The Tappan School, in East Boston, has been closed until January, on account of the wretched condition of the building. We recently noted the reports circulating about this building, and are glad to see that the School Committee have acted with promptness in the matter.

The danger of sending children threatened with diphtheria by having sore throats, to a school among 40 or 50 children in an imperfectly ventilated school room, is made the subject of a recommendation by the Philadelphia *Bulletin* that parents and others to procure the rules lately proposed by the Board of Health, and to have them left at every house in that city.

Judge Walling, of the Monmouth County Court, on application of the Public Prosecutor, has issued an order commanding the Commissioners of Long Branch, the Commissioners of Asbury Park, the Ocean Grove Association, and the Ocean Beach Association to show cause why they should not be required to plead to the presentments found by the Grand Jury and recently filed, respecting the allowing of sewage to pass into the waters of Long Branch Brook, Wesley and Sunset Lakes, Shark River, and other adjacent waters to the Atlantic coast, all of which are under the jurisdiction of the court.—*Newark Journal.*

After a spirited contest, the Medico-Legal Society, Dec. 6, re-elected Clark Bell, their President. The other officers elected were as follows:—R. Ogden Doremus, and Delano C. Calvin, Vice-Presidents; L. P. Holmes, Secretary; Gilbert R. Hawes, Assistant Secretary; Moritz Ellinger, Corresponding Secretary; Dr. Andrew H. Smith, Curator and Pathologist; R. S. Gurnsey, librarian; Dr. E. H. M. Sell and Benjamin A. Willis, trustees; Dr. Morris H. Henry and A. G. Hull, members of the permanent commission. Dr. O. W. Wight, of Detroit, Mich., presented a paper, read by title, on Experts and Expert Testimony.

At Indianapolis, on the 13th inst., the annual convention of the Indiana Tile and Drainage Association was held. The Presiding officers were: President, Robert Thomas, of Indianapolis; Recording Secretary, J. B. Macy, of Russellville, and J. J. W. Billingsby, of Indianapolis, Corresponding Secretary. Gov. Porter delivered the opening address. Prof. H. W. Wiley, of Perdue University, introduced the subject of "Clays." Dr. R. T. Brown, of Indianapolis, spoke on the "Effect of Drainage on Soil," and W. A. Armstrong, of Rossville, Ill., on "Experiences in Drainage." The attendance was from Ohio, Michigan, Illinois, Iowa and Missouri, with 150 members of the State of Indiana.

The discussion among railway men, the past year, about the practicability of holding a national exposition of railway appliances, has resulted in a determination to give the plan a test next spring. Arrangements have progressed so far that the Inter-State Exposition buildings near Chicago have been secured and the date of opening set for on or about May 31, 1883. The carrying out of the scheme is in the hands of a Board of Commissioners composed of the following gentlemen: Lucius Fairchild, ex-Governor of Wisconsin and late Minister at Madrid, Spain; George M. Pullman, President Pullman's Palace Car Co., Chicago; Aaron French, Pittsburgh Car Spring Co., Pittsburgh; J. McGregor Adams, Adams & Westlake Manufacturing Co., etc., Chicago; E. V. Cherry, Vice-President Post & Co., Railway Supplies, Cincinnati; A. G. Darwin, President Allen Paper Car Wheel Co., New York; O. W. Potter, President North Chicago Rolling Mill Co., Chicago; H. E. Sargent, late General Manager Northern Pacific R. R., Chicago; James McMillan, President Michigan Car Co., etc., Detroit; George Westinghouse, Jr., President Westinghouse Air Brake Co., etc., Pittsburgh; J. H. Bass, Proprietor Bass' Car Wheel Works, Fort Wayne; E. H. Williams, Baldwin Locomotive Works, Philadelphia; Wm. S. Eaton, National Tube Works Co., etc., Boston.

During November the total number of nuisances reported to the Board of Health of Philadelphia, Pa., was 526, of which 329 were found to be detrimental to the public health, and 98 were dismissed by the Board. A number of fines were imposed on various persons and corporations for violating rules of the Board.

The health of children at Rochester is to be protected from diphtheria prevalent there, by excluding those residing in houses where cases are found from attending schools and by a quarantine of the diphtheritic cases.

Lieut.-Col. Bolton, Water Examiner for London, again points out in a report on the water supply of the metropolis the past year that the quality of the water used in domestic consumption depends very much upon the care taken by the consumer to guard against its contamination after it has been distributed from the mains. Foul cisterns and defective or misplaced communication-pipes, are, as might be expected, fertile sources of impurity.

IS THIS A CASE OF PLAGIARISM?

To the Editor of THE SANITARY ENGINEER:

In the supplement to your issue of Dec. 7, you give very full abstracts of the report of Mr. Samuel A. Robinson, the Inspector of Plumbing of the District of Columbia, to the Health Officer of the district. Being interested in every movement intended to improve the usual faulty condition of plumbing work in city houses, I began to read the report with considerable interest, but was soon quite surprised to find in it sentences quite familiar to me. Upon further examination I found that Mr. Robinson had made extensive use of my report on "House Drainage and Sanitary Plumbing," made this summer to the Rhode Island State Board of Health, and published in its Fourth Annual Report.

Had Mr. Robinson observed the most ordinary courtesy of giving credit to writers from whom he quotes, it could, perhaps, have been considered a compliment that an American should use in a report expressions and sentences, written by a foreigner, who has been but a few years in this country. But Mr. Robinson has chosen to use not only many of my sentences, slightly changing some by leaving out words or substituting one word for its synonym; he has also used matter from other writers *quoted in my report* without mentioning the name of the author. It seems to me that such a violation of the usual custom of compilers deserves the strongest condemnation of your paper and all its readers. This seems to me to be a piece of flagrant plagiarism, and as you have devoted considerable space in your columns to the review of this report, it would be but just to me that the facts in the case should be made public.

In support of the above, I quote below in juxtaposition, extracts from both reports.

MR. GERHARD'S REPORT.	MR. ROBINSON'S REPORT.
1. The earthenware drain should end at about five to ten feet outside of the foundation walls of the house. From this point towards the inside of the house the drain should be of iron. The joint between iron drain and earthenware pipe should be made with pure hydraulic cement. Where the iron pipe passes through the wall, a relieving arch should be built over it. Settlement of walls often occurs, and is liable to crack the pipe or even break it, unless the above provision is carried out. It is quite evident that, under no circumstances whatever, this part of the house drain should consist of vitrified pipe. Important as it is to have the drains outside of the house free from sediment or leakage, it is still more so to have all the pipe joints inside of the dwelling perfectly air and water tight, etc.	1. The earthenware drain should end at about five (5) feet outside of the foundation walls of the house; the joint between the iron drain and the eathenware pipe should be made with pure hydraulic cement, and where the iron pipe passes through the wall, a relieving arch should be built over it to prevent the pipe from being broken by the settlement of the walls, which often occurs. Important as it is to have drains outside of the house free from sediment or leakage, it is still more so to have all the pipe joints inside the house perfectly air and water tight, etc.
2. In order to effect a constant movement and change of air in the pipes two openings are required, an outlet and an inlet. The extension of the soil pipe through the roof provides only an escape for the foul air generated in the soil pipes and waste pipes through the decomposition of foul organic matter clinging to the interior of pipes and lodging in traps under water closets and fixtures. But in order to oxidize and thus render harmless this matter undergoing putrefaction within the pipes, a constant introduction of fresh air from the outside atmosphere is necessary. As the soil pipe is warmer in winter time (being in the constantly heated house) than the fresh air pipe located outside of it, an almost constant upward current in the soil pipe results. In summer time this current is only seldom reversed; for, as a general rule, the top of soil pipe is heated by the sun more than the fresh air pipe near the ground.	2. In order to effect a constant movement and change of air in the pipes two openings are required, an outlet and an inlet. The extension of the soil pipe through the roof affords an escape of the foul air generated in the sewer by the decomposition of foul organic matter clinging to the inner surface of the pipes. In order to render harmless this matter undergoing putrefaction, a constant introduction of pure air from the outside is absolutely necessary; and, as the soil pipe is warmer in winter (being in the house) than the fresh air pipe located near the ground in front, the result is an almost constant upward current in the soil pipe. This I have found to be the case even with the soil pipe on the outside of the house, for the reason that it is heated more by the sun than the fresh air pipe near the ground.
3. A trap is practically a suitable bend or dip in the drain, which retains a sufficient quantity of water to prevent the passage of air or sewer gas from the sewer to the house drain.	3. Most persons are familiar with the running trap, which is practically a bend in the drain, holding a sufficient quantity of water to prevent the passage of air or sewer gas from the street sewer to the house drain.
4. It is the purpose of this paper without in any way adding to the "plumbing scare," clearly to define wherein the danger consists, but at the same time to establish rules for the proper drainage and plumbing of houses, which, if carefully observed, will secure to the anxious house owner work of superior quality and of a positively safe character. * * * * Even a small house is nowadays generally provided with a kitchen sink, a water closet and sometimes a bath tub, while in a costly modern residence, arranged with an elaborate system of plumbing, we find kitchen, pantry and scullery sinks, slop sinks, laundry tubs, stationary wash basins in closets near bedrooms, a great number of bath or dressing rooms, with water closets, urinals, bath and foot tubs, bidets and other fixtures. The suggestions and recommendations of this report apply with equal force to the drainage and plumbing of tenements, small houses, costly residences, villas, apartment houses, hotels, factories, school houses or public buildings.	4. The law now requires every new house to be connected with the sewer, and consequently even a small house is generally fitted up with a kitchen sink, a water closet, and sometimes a bath tub, while in a more expensively built residence, arranged with a more costly system of plumbing, we find in addition to the above, stationary washstands, near sleeping apartments, a number of bath and dressing rooms, having in them water closets, urinals, foot tubs, bidets and other fixtures. The regulations of this department apply with as much force to the drainage and plumbing of small houses as they do to the most costly residences. The same protection is given to all, and as these rules have been established for the proper drainage and plumbing of houses, the public may rest assured, that, when they are carefully observed and strictly complied with, there can be no danger of escape of sewer gas or foul odors in their dwellings.
5. The foulest part of the pan closet is the receiver, for the solids gradually accumulate on its sides, as these receive no washing from the flush. The filth soon undergoes decomposition, and the resulting gases, having been confined by the double water seal of the pan and the trap, are expelled into the apartment at each use of the closet. * * * * * * * Some of the enumerated defects may be remedied; by enameling the inside of the cast iron receiver; by ventilating it by an inlet pipe for fresh air and a vent pipe; by having special flushing arrangements for the container. * * But by all these costly improvements the *only* merit of the pan closet, its cheapness, is annihilated, and a better water closet may as well be used. As long as a house is fitted with pan closets of whatever pattern, it may be said not to have reached the standard of safety from a sanitary point of view.	5. * * * but I must not omit to say that a house fitted up with a pan closet of whatever pattern, in a sanitary point of view, is unsafe, no matter what care has been taken to ventilate the soil and waste pipes. The most offensive part of the pan closet is the receiver or cast iron container under the bowl, for the solids gradually accumulate on its sides; this filth soon undergoes decomposition, and the gases that are confined between the pan and the trap escape into the apartment whenever the closet is used. To remedy all the defects of the pan closet by enameling, ventilating containers and having special flushing arrangements, would make it more expensive than any of the modern closets now in use.
6. The following valuable remarks of Mr. Edw. S. Philbrick upon this subject so fully express my own views, that I quote them *in extenso.** * See articles on "Domestic Sanitation" in THE SANITARY ENGINEER, Vol. II. "The location of plumbing fixtures in dark corners, under stairways and in closed closets is always to be avoided," etc. * * * "The less amount of woodwork the better," etc. * * * "It may not be always possible to to enforce such discipline, but the less it is enforced, the more important become the items of light, air and simplicity of construction, as aids in the same direction. The latter are generally under the control of the architect, and his mistakes of planning entail a *permanent* and incurable evil," etc., etc. * * * * "While every aid should be given to cleanliness by simplifying the apparatus, no amount of perfection in this respect will avoid the need of constant thought and care on the part of those who use the fixtures," etc.	6. The less amount of woodwork about set figures, of any kind, the better, and every aid should be given to cleanliness by having them exposed to light and air. This is generally under the control of the architect, whose mistakes in planning have been the cause of incurable evils, and much unnecessary trouble to house keepers in so boxing fixtures as not to admit of frequent and thorough scrubbing. The location of plumbing fixtures in dark corners, under stairways and in closed closets, should always be avoided.

All this occurs not in a private report, but in an *official* report of a *public officer*.

Very respectfully, yours, WM. PAUL GERHARD.

NEWPORT, R. I., *Dec.* 9, 1882.

[Our abstract of Mr. Robinson's report was made from a written copy sent to us by him. Whether in the report sent to the Health Officer he made any acknowledgments of the value Mr. Gerhard's reports had been to him we have no means of knowing, as it has not yet appeared in print. That it has been of service is quite evident. In justice to Mr. Robinson, it should not be forgotten that the principles of house sanitation were the common property of sanitarians long before either Mr. Gerhard's or his report was written. All have been known and held in common for at least 10 years, and many for 30 or 40, and and it is not now possible for writings on the elements of the subject, such as these two reports are, to be in any considerable degree original; and any man competent to occupy such a position as inspector of plumbing is, as a matter of course, familiar with such facts as are mentioned in the Report on the Plumbing of the District of Columbia. Mr. Gerhard was careful to give credit when he quoted another's language, and we can appreciate his feelings, since we, almost every week, see our own matter appropriated without credit given. We hope Mr. Robinson may be able to explain his apparent want of fairness.]

Reviews of Books.

JOURNAL OF THE ASSOCIATION OF ENGINEERING SOCIETIES. Boston, St. Louis, Chicago, Cleveland. Vol. I, November, 1881, to October, 1882. Published by the Board of Managers of the Association of Engineering Societies.

This volume of 430 pages comprises fifty-five papers on engineering subjects contributed to the four societies which unite in publishing their proceedings. The selection has been, in general, judiciously made by the managing committee and the result is an interesting and valuable addition to current engineering literature. The co-operation of the societies in this matter has, of course, reduced the cost and ncreased the circulation of the papers, which having been read before local societies of comparatively small membership could not well have been published except by such co-operation. There is, of course, a great variety in the topics treated and in the value of the papers. Generally they are practical and to the point. The greatest deficiency is in discussions of the papers by members other than the authors. There does not seem to have been any discussion or remarks on the great majority of the papers here printed. Indeed, some of them were never read at a meeting of engineers, except by title, and of those which were read and discussed, but few and meagre memoranda of the discussions are printed. It is no disparagement of the papers themselves to say that their value would be immensely enhanced if the discussions by those who heard them read and the author's replies were given in full. It is not uncommon for the criticisms or explanations of a paper read before an association of civil engineers to be worth more than the paper itself, for that is frequently prepared from one point of view and a limited experience, and sometimes cross examination, so to speak, puts an entirely different face on the subject.

The papers of especial interest to engineers who are engaged on sanitary work are, Mr. Fteley's on the percolation of water through sand, Mr. Benezette Williams' description of the sewerage of Pullman, Ill., Mr. Robert Moore's tables for determining the proper size of sewers, Mr. Gerhard's diagrams for determining the velocity and discharge in sewers, and Prof. Nichols' on the tastes and odors of some surface waters, Mr. Kingley's on water wastes and water meters and Mr. Brackett's tests of the Deacon system for detecting waste of water.

A good topical index alphabetically arranged is issued with the twelfth monthly number, which completes the first volume of this commendable enterprise of the local engineering clubs.

The *Wide Awake* for December is particularly good. One of its frontispieces, represented by a steel engraving, is the beautiful group of "Mother Child and St, John," from Bougereau's painting. Rose Terry Cooke writes a story called "A Case of Coincidence"; Eggleston, Ed. Everet Hale, Celia Thaxter, Mrs. Whitney, Tennyson, Christina Rosetti, all contribute. There are illustrated papers for boys about "Health and Strength," by Prof. Sargent; on "Eversly Dogs," by Rose Kingsley; "The Microscope," Samuel Wells; "The Workshop," "Christmas Carols," Geo. L. Osgood; "Cookery," Marion Harland; Stories about the Chinese and the Quakers, and illustrations are to be found throughout the number.

CONTRACTS AWARDED.

JERSEY CITY.—The contract for cleaning the streets has been awarded to Patrick Sheeran for $17,995.

NEW YORK.—A second contract for dredging Buttermilk channel has been awarded by Gen. Newton to Henry Dubois for 25 cents per cubic yard, the work being limited to an expenditure of $60,000, the amount of the appropriation.

CHICAGO.—The Commissioner of Public Works has re-advertised for bids to furnish all the fire hydrants and stop-cocks needed by the city. Two bids had been received, each for the same amount $49.50 a ton, from J. H. Bass, and the Union Foundry & Pullman Car Wheel Works Co. The Union Foundry & Pullman Car Wheel Works Company has received the contract at $45 a ton, for special castings for city water pipes. Last year about $6,000 was paid out for this purpose.

Proposals were received to furnish new City Hall with a fire alarm telegraph wire tunnel; engine room floors and boiler room floors as follows:—

Angus & Gindeh	$5,985
Wm. Manson	6,293
E. G. Gobel	6,493
Robinson & Minor	6,570

The Contract was awarded, December 14, to Angus & Gindeh.

COLUMBUS, O.—Bids for slate tiling and base for the new asylum for Imbeciles were received by the Board of Trustees, Dec. 7, as follows:—Star Encaustic Company, of Pittsburg, tile floor, $10,330; W. R. Kinnear & Co., of Columbus, slate floor and slate base, $21,792; Great Western Marble Works, Cincinnati, slate floors, $11,893.09, and slate base, $2,100; American Encaustic Flooring Company, of Zanesville, tile floors, $7,558 20, and slate base, $2,400; United States Encaustic Company, of Indianapolis, tile flooring, $7,385, and slate base, $1,736; Henry Dibblet, of Chicago, representing Maw & Co., England, slate floors and base, $10,500, and for encaustic tile floor and base, $9,350.

HOT SPRINGS, ARKANSAS.—Bids were received at the office of the Secretary of the Interior, December 15, for excavation, building wall of granite masonry, laying concrete, and furnishing and laying 12-inch earthenware and 6-inch iron pipe. Omitting bids for granite masonry, concrete and excavation. Those for the pipe were as follows:

	12 in. earthenware pipe, per lin. ft.	*6-in. iron pipe, per lin. ft.*
Carl Miller & Patterson, St. Louis, Mo	$1.50	$1.25
Aldrich Welshbellic & Co., Hot Springs	1.25	1.50
John McKim, New York City	1.20	1.40
C. W. Frey	.85	1.25
Dillow & Wherry, Little Rock	.65	2.00
D. Pullman, Opposition, Ark	.98	2.00
G. Eyerman, St. Louis	.77	1.45
J. H. Dewes, Washington, D. C	terra cotta .29	.99
M. A. McGowan & Co., Washington, D. C.	1.60	1.90
A. P. Robinson	.90	.55
P. Maloney and Jas. Reynolds	terra cotta 1.50	1.40
Hecox & Martin	1.00 for T's and 2.00 for ventilators .60	1.85
Henry Farrell	.62	1.75
Gustav Wilke & Co	.80	1.50
John Burnes	3.00 ven. .80	3.00
G. C. Rumbough	each, T's 2.60 .62	1.95

No award is yet made.

BROOKLYN.—The contract for heating and ventilating public school-house No 7 has been awarded to the H. B. Smith Co., of New York, for $4,865, Other bids were as follows:

Gold's. Heater Manufacturing Co	$4,978
E. Rutzler	5,735
Bates & Johnson, without boilers	3,750

DISPUTE OVER BIDS FOR PLUMBING MATERIALS IN BOSTON.

The action of Assistant Treasurer Kennard in allowing a bid to be received for plumbing the post office extension after the hour for closing the bids, as reported in the morning *Herald*, is severely denounced by those firms who had their bids in at the time specified in the advertisement. A member of the firm of Dalton & Ingersoll, one of the firms who bid for the contract, says he was present and remonstrated with Mr. Kennard, informing that gentleman that he didn't consider it a fair way of doing business; that the hour announced for closing the bids was 12 o'clock, and that no bids should have been received after that hour; that there was ample opportunity for some one to catch the figures as they were called out, and then make up a set of figures and present them. It was stated that Mr. Kennard announced that, as the recording of the bids was in progress, it was not too late to receive a new bid, but on this point the gentleman says that the recording had been finished before the arrival of the new bidder.

The following communication is self-explanatory:

"OFFICE OF PHILLIPS & WEEDEN,
84 NORTH ST., BOSTON, *Dec.* 13, 1882.

To the Editor of the Herald:

In this morning's issue of your paper we find an article in regard to the bids for plumbing material required for the "new post office and sub-treasury extension," and, as the article reflected upon us (the lowest bidders) we feel obliged to make a statement in reply to certain rumors circulated by a competitor. In regard to the award we await the decision of the authorities, knowing it will be based upon the facts and figures, unbiassed by a disappointed bidder. The fairness and freedom from fraud of our bid was only questioned by one firm, and they a direct competitor in our line of business, and at this writing we have heard nothing from the other bidders. The assertion that a sign or communication was given us by the government officials is so absurd as to be unworthy of notice, and the high character they bear and esteem in which they are held will permit no one to entertain such a thought. The gentlemen are strangers to us, we never having met them. It would have been impossible to have altered our bid at a short notice, as it was written on four pages of long bill paper and the price of each article and the gross amount for the quantity of each article was extended separately. On reference to our bid, no erasure of any kind will be found. Trusting you will find space for this letter with the accompanying affidavits, we are, very respectfully,

"PHILLIPS & WEEDEN."

Accompanying the above letter are sworn statements of the firm, in which they state that they made up their figures prior to handing them to the assistant treasurer, and wrote upon the proposals the following memorandum: "We will furnish above goods for $9,924 36. Phillips & Weeden."—*Boston Herald.*

(Continued to page 63.)

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

264,082. GASOLINE STOVE. PAUL HIEKISCH, Decatur, Ill. Filed Mar. 6, 1882. (No model.) Issued Sep'. 12. 1882.

Claim.—1. In combination with the cup and curved generating-tube, the part B, constructed, substantially as shown, with a vertical tubular projection adapted to screw on to the lower end of the curved generator A, the gas chamber A[1], formed in its lower part with an orifice, *a*, controlled by the screw valve B[11], fitted into a laterally projecting stem and the disk *i*[1] forming one end of said gas chamber, substantially as herein shown and described.

2. In a gasoline stove, in combination with the part B and cup C, the curved generating tube A, provided with two inlet orifices, one at the end of the horizontally extended portion and one on the under side of the horizontally extended portion, as shown, the part B having two valves, constructed and arranged substantially in the manner shown, and for the purpose specified.

3. In combination with the tank I, supply pipe G[1], and valve, the main body of which unites the two—viz., the tank and supply pipe—the wire gauze filter *h h*, secured to the side of said valve and covering the orifice thereof, substantially as shown, and for the purpose specified.

264,116. HOT-WATER HEATING APPARATUS. HENRY SWINDELL, Allegheny, Pa. Filed Dec. 10, 1881. (No model.)

Claim.—1. A heater for railroad-cars, halls and other places, consisting of a coil or coils of pipe within a heating-cylinder, and connected with a water supply or head, and having a circulating pipe or pipes which return and discharge into the heating coil or coils, substantially as and for the purposes described.

2. A heater consisting of a conical heating-chamber, and two interlacing diagonally-coiled heating-pipes having circulating-pipes which extend from the lower ends of the coils and return and discharge into the upper ends, in combination with a water-supply tank, an annular opening between the tank and pipes, and a suitable lamp or other heating device, substantially as and for the purpose described.

3. The combination of the heating coil or coils of a hot-water heating apparatus with the circulating pipe or pipes discharging thereinto, and a water-supply pipe or channel also discharging thereinto, substantially as and for the purpose described.

264,177. VENT-FAUCET. ADOLPH LUHRS, New York, N. Y. Filed June 9, 1882. (No model.)

Claim.—In a vent-faucet, the spigot B, having in its smaller end the axial aperture *i*, and single angular branch aperture *j* on the latter, and having the indicating-mark *l*, in combination with the faucet-body A, tube E, and nut *f*, for operation substantially as described.

264,241. LOCK-FAUCET. WILLIAM S. CAMPBELL, New Orleans, La. Filed Mar. 18, 1882. (No model.)

Claim.—1. The combination of a faucet with rotary plug B, having a slot or recess, B,[2] in its end, a key, E, adapted to enter said recess and turn said plug, and pins *d* and springs *d*,[1] which serve as a lock, substantially as set forth.

264,314. FILTER. WILLIAM MAYNARD, New York, N. Y. Filed Nov. 11, 1881. (No model.) Issued September 12, 1882.

Claim.—1. A filtering medium composed of corundum in the form of a porous conglomerate, as described.

2. The combination, with a filter case or chamber, of a rigid porous filtering medium having a hole through the same provided with an elastic medium substantially as and for the purpose described.

264,315. PORTABLE WATER CLOSET. JOHN MCAULIFFE, Portland, Conn., assignor to himself and John J. Barry, same place. Filed May 1, 1882. (No model.) Issued September 12, 1882.

Claim.—1. The hollow cover B, constructed to discharge water when closed, in combination with the box A, seat *a*, bowl *c*, and pan *d*, substantially as described.

2. In portable closets or commodes, the cover B, provided with discharge-pipe *i*, partition *h*, and tray *k*, in combination with the seat *a* and box A, substantially as shown and described.

264,320. AUTOMATIC CUT-OFF FOR GAS BURNERS. GILL W. METCALFE, Baltimore, Md., assignor of one-half to S. Silberschmidt, same place. Filed June 17, 1882. (No model.) Issued September 12, 1882.

Brief.—Spring C is placed against *a*, and the gas lighted. C is expanded and slips by *a* and is caught by *a*[1], where it is held. If the flame be extinguished, C contracts and is thrown outward from the burner, and the weight E falls to turn off the gas.

Claim.—The combination, with the gas burner and the perforated gas-cock, of the bent bar C, having both legs on the same side of the burner, with its bent end uppermost, and one leg attached to the burner and the other free, and the elbow-lever, having one arm provided with lugs *a* and *a*[1] in different planes with respect to the end of the bar C, and the other arm provided with a weight, substantially as shown and for the purpose described.

264,342. VALVE FOR WELL BUCKETS. WILLIAM H. ROE, St. Joseph, Mo. Filed Mar. 10, 1882. (No model.) Issued September 12, 1882.

Claim.—In combination with a reversible well-bucket bottom and its valve, the valve-connection A, consisting of the central horizontal part, 2, the arms 1 1, the said central part being placed outside, and said arms being connected at their ends to the valve, substantially as described.

264,402. ABSORBENT CUSHION FOR HYDRO-CARBON-BURNERS. CHARLES F. BURLEIGH, Pawtucket, R. I. Filed July 15, 1882. (No model.) Issued September 12, 1882.

Claim.—1. In a hydro-carbon oil burner of the character herein specified, a cushion of cork secured to the burner-plate bearing the wick-tubes, substantially as and for the uses and purposes shown and described.

2. In a hydro-carbon-oil burner for stoves, a removable burner-plate wherein are located the wick-tubes, the edges of said plate being bent over and holding in place a cushion of cork, which presses against a collar upon the oil-pot, substantially as shown and described.

3. In a hydro-carbon-oil burning stove, a burner-plate wherein are located wick-tubes, the edges of said plate being bent over, as set forth, and holding in place an absorbent cushion, in combination with a collar affixed to or forming a part of the oil-pot, substantially as shown and described.

4. In a hydro-carbon-oil burner for stoves, a cushion of absorbent material located and held in place upon the oil-pot, as set forth, in combination with a burner-plate adapted and arranged to be secured in place thereon, substantially as shown and described.

5. Oil-pot A, bearing-collar D, burner-plate B, having bent edges E, and cushion H, the whole combined and arranged to operate substantially as shown and described.

264,408. HEATING APPARATUS. EPHRAIM H. GRAVES, Morrison, Ill., assignor of one-half to O. F. Woodruff, same place. Filed Feb. 10, 1881. (No model.) Issued September 12, 1882.

Claim.—In combination with the discharge-pipe G and cross-pipes *e* and *d*,, the cylinder H, substantially as shown and for the purpose described.

264,463. FILTERING AND PURIFYING WATER IN WELLS, GEORGE KOEPPEL, Alma, Wis. Filed May 13, 1882. (No model.) Issued September 12, 1882.

Claim.—The described apparatus for purifying water in wells consisting of a box or case having a raised and perforated bottom and containing alternate deep layers of charcoal and sand, the charcoal being at the bottom and having side perforations located on a level with the charcoal only to permit the passage of water through the box directly to and from the charcoal only and thence to and through the sand.

264,050. APPARATUS FOR HEATING CARS. MAURICE J. WALSH, New York, N. Y., assignor by mesne assignments to Louis Fitzgerald, same place. Filed May 25, 1882. (No model.) Issued Sept. 5, 1882.

264,126. GAS-ENGINE. CHARLES GRANTLEY BEECHEY, Liverpool, England, assignor to William Thompson Mann, James Gregson Chapman, Alfred Chapman, Henry Shield, and Alexander Spiers, all of same place. Filed Dec. 29, 1881. (No model.) Patented in England July 6, 1881, No. 2,961; in France Dec. 22 1881, No. 134,503, and in Germany Dec. 24, 1881, No. 55,051.

264,154. OIL-STOVE. LOUIS C. HECKMAN, Cleveland, Ohio. Filed April 10, 1882. (No model.)

264,155. OIL-STOVE. LOUIS C. HECKMAN, Cleveland, Ohio. Filed Feb. 24, 1882. (No model.)

264,158. SMOKE AND GAS CONSUMING FURNACE. DE WITT C. HILL, Willimantic, Conn., assignor of two-thirds to John Scott, same place, and William E. Barrows, Hartford, Conn. Filed Aug. 25, 1881. (No model.)

264,227. DYNAMO-ELECTRIC MACHINE. GEORGE W. BEARDSLEE, Brooklyn, N. Y., assignor to William F. Jobbins, East Orange, N. J. Filed May 9, 1882. (No model.)

264,328. ELECTRIC LAMP. ALBANUS W. MORTON, Rahway, N. J. Filed Dec. 22, 1881. (No model.) Issued September 12, 1882.

264,338. PUMP-VALVE. CHARLES C. REDMOND, San Jose, Cal., assignor to Milton Campbell, same place. Filed May 8, 1882. (No model.) Issued September 12, 1882.

264,346. ELECTRIC LAMP. HERMANN SEDLACZEK and FRANZ WIKULILL, Leben, Austria, and Sigmund Schuckert, Nuremberg, Bavaria, Germany. Filed Jan. 19, 1882. (No model.) Patented in Germany, June 6, 1879, No. 8,580; in France June 11, 1879; No. 131,152; in Belgium June 12, 1879, No. 48,449, and Apr. 20, 1881, No. 54,26; in Austria-Hungary Aug. 6, 1879, No. 19,078, and Oct. 28, 1879, No. 29,952, and in England Apr. 12, 1881, No. 1,590. Issued September 12, 1882.

264,387. CHAIN PUMP. CHARLES WHIPPE, LEONARDSBURG, Ohio. Filed Apr. 17, 1882. (No model.) Issued September 12, 1882.

264,406. CARBURETING APPARATUS. AARON W. FRAIL, Ashland, Mass., assignor to himself and Albert Whiting Eames, same place. Filed Mar. 18, 1882. (No model.) Issued September 12, 1882.

264,517. INCANDESCENT ELECTRIC LAMP. WM. CROOKES, London, England. Filed August 1, 1882. (No model.) Patented in England Aug. 31, 1881, No. 3,799; in France September 30, 1881, No. 145,080, and in Italy May 26, 1882, No. 14,225. Issued September 19, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Notes and Abstracts.

For the week ending December 9, of a total urban population of 6,799,735, there died 2,655, which corresponds to an annual death rate of 20.3 per 1,000, which is less than that for the preceding week in which it was 21.3. The rate was highest in New York city and Philadelphia, in both which cities it was 23.4. The folly of estimating the healthfulness of a city from the data of a single week is well illustrated in the above table, in which Louisville has a mortality corresponding to 10.9, and Terre Haute to only 5.2 annual rate per 1,000. In the table of last week the Louisville rate was 23.9, and the Terre Haute rate eight. The ratios in the above table, which are really valuable as indications of relative healthfulness for the week, are not those for single cities, but for the several groups of cities. For a single city the death rate for the week should be compared with that of three or four preceding weeks to get a fair average.

The fact that the mortality rate for the River cities for the week is only 16.6, while that of the Eastern cities is 22.4 is really significant. Diphtheria is increasing in the River cities, but the large number this week is largely due to the appearance of St. Louis for the first time in this table. Deaths from small-pox are reported during the week from Philadelphia four, Chicago one, Pittsburgh one, Louisville one and Nashville one.

The low death rate among the white inhabitants of Southern cities is due to the almost complete absence of diphtheria and scarlet fever, and the comparatively small amount of acute lung disease. The zymotic disease which is at the present time most threatening in the United States is diphtheria.

NEW YORK CITY.—Dr. B. H McCann, examining physician for the Board of Commissioners of Public Charities and Corrections, shows that during the month of November, 1,879 applicants for medical relief were examined, of which number 1,839 were admitted to hospital. The figures for the preceding month were 1,477 applications and 1,455 admissions, the increase being the usual one on the advent of cold weather.

Of the cases admitted to hospital in November, 145 were general diseases, 54 fevers, 298 diseases of the respiratory organs, 444 were surgical cases and injuries, and 198 cases of alcoholism. Bellevue Hospital received 879. Charity Hospital 504, and the Homœopathic Hospital 379. 1,149 were male and 687 female adults. One male and two female children.

PITTSBURGH, PA.—Dr. Wm. Snively reports eight cases of small-pox.

SANDWICH, ILL.—Dr. Ballou reports the continued prevalence of the epidemic of measles.

LOUISVILLE, KY.—Dr. E. R. Montgomery, health officer, reports the occurrence of 12 cases of small-pox during the week.

BOSTON, MASS.—C. E. Davis, Jr., reports 58 cases of diphtheria, 25 of scarlet fever and 12 of typhoid.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports 13 cases admitted, three discharged and three dead, leaving 1,350 under treatment.

PROVIDENCE, R. I.—Dr. E. M. Snow reports the epidemic of typhoid as decreasing rapidly; only five cases that commenced in the month of December were reported during the week. There is still a large number of persons suffering from the disease. With the exception of typhoid fever the health of the city is as good as the average for the

Digitized by Google

season. Of the 47 decedents reported during the week 11 were under five years of age and the same number were sixty years and over that age.

BALTIMORE.—The total number of deaths reported in Baltimore for the week ending Dec. 9 was 178, of which 67 were under five years of age, and 34 were people of color. According to the estimate of the population based on the United States census this gives a mortality equal to an annual rate of 26 per 1,000. According to the estimate of population made by the Registrar it is 22 63 per 1,000. Diphtheria and small-pox continue prevalent, there having been 20 deaths from the former and 23 from the latter. Twenty-four deaths are reported from consumption, 2 from measles, 4 from scarlet fever, 2 from typhoid fever and 4 from croup.

RAVENNA, PORTAGE CO., O.—The postmaster reports a fatal case of small-pox. No new cases have as yet developed.

DETROIT, MICH.—Dr. O. W. Wight reports 41 cases of scarlet fever and 12 cases of diphtheria during the week.

MICHIGAN.—Dr. H. B. Baker, Secretary State Board of Health, in his bulletin for the week ending Dec. 2, reports the following diseases in their order of greatest area of prevalence; neuralgia, bronchitis, rheumatism, consumption, intermittent fever, tonsillitis, remittent fever and influenza. Neuralgia has greatly increased in area. Cholera morbus, diphtheria, erysipelas and whooping cough have increased, while intermittent and typho-malarial fevers have decreased.

NEW ORLEANS, LA.—The report for the week ending Dec. 2 was received too late to be embraced in our table of last issue. The deaths numbered 136—85 of the decedents being white and 51 colored, giving an annual rate for the white population of 27.31 and for the colored a rate of 44.77. Small-pox caused nine deaths, measles one, scarlet fever one, cerebro-spinal fever one, typhoid fever two, malarial fevers nine, diphtheria one, consumption 22, pneumonia five, diarrhœa and dysentery 12 and accidents, three deaths.

PORT OF NEW YORK.—Immigrant Inspection Service.—During the week ending Dec. 2 there arrived 4,848 immigrants, of whom 67 were vaccinated at the quarantine station. Dr. Wm. M. Smith, Health Officer of the port, in transmitting the report of the quarantine inspector, says "The Surgeon of the *Gellert* certified to having found 348 sufficiently protected by vaccination and vaccinating 600. The vaccinations were not made until four days before entering this port, consequently the results of his vaccination could not be satisfactorily determined, nor could it have protected the emigrants from any contagion of small-pox, if any had been received before embarkation. There were five cases of diphtheria, 12 of measles, one of pneumonia, and several of capillary bronchitis among the emigrant passengers. The cases of diphtheria and measles were promiscuously mixed in rooms opening into the narrow gangway connecting the forward steerage and the second cabin saloon, and along which the steerage passengers were constantly passing. Each hospital room was occupied by five or six patients, and several attendants or friends. The portlights were closed, so that little or no ventilation was secured except as it came through the doors which opened into the gangway. When closed the atmosphere of the hospitals soon became offensive and injurious to the occupants, and when opened the contaminated hospital air was inhaled by the passengers passing along the gangways, and by those occupying the forward steerage. In two rooms opposite to the hospitals of the sick, separated by the gangway referred to, were five "lying-in" women. Three deaths were reported to have occurred on the passage, and several more are said to have occurred before the sick reached the emigrant hospital on the day following their arrival."

DETROIT, MICH.—Immigrant Inspection Service. The report of Dr. Mulheron for the week ending Dec. 2, shows the arrival of 331 immigrants, of whom 27 required vaccination.

PORT HURON, MICH.—Immigrant Inspection Service.—The report of Dr. H. R. Mills, for the week ending Dec. 2, shows the arrival of 549 immigrants, of whom 461 were Canadians and 88 Europeans by way of Halifax, New York and Portland. Three hundred and fifty-six of these required vaccination, which was performed by the inspectors.

HORNELLSVILLE, N. Y.—Dr. Elisha Harris, Secretary State Board of Health, in a paper on the movement of infectious diseases, records a case of small-pox taken from the cars by the State Inspector at this station on Nov. 9. The case was *en route* from Cincinnati. One of the railroad employés who was exposed to the infection took sick two weeks afterward and died of the disease. He had been vaccinated 19 years before, and had two well marked vaccine scars on his arm. Vaccination protected all other persons exposed to infection from these two cases.

In a second paper Dr. Harris records the occurrence of a death from diphtheria on the cars of the N. Y. Central R. R., in the family of an immigrant arrival by the S. S. *Gellert* (see item Port of New York). Dr. Harris refers to plans which, when perfected, will secure the separation and isolation of cases of infectious disease among immigrants by the coöperation of the Commissioners of Emigration and the Health Officer of the Port with the State Board of Health.

ENGLAND.—The returns of the Registrar-General for the week ending November 25, shows an average mortality rate of 24.2 per 1,000 in the 28 principal towns. The highest ratio was registered in Sunderland, 47.8; the lowest in Bolton 14.7. The rate in London was 22.5. The 29 deaths from diphtheria in the 28 towns included 16 in London, four in Liverpool, three in Sunderland, two in Birmingham, and two in Sheffield. Small-pox caused two deaths in London, two in Manchester, and one in Newcastle-upon-Tyne.

SCOTLAND.—Consul J. A. Leonard transmits the return of the Registrar-General for the week ending November 25. The lowest mortality was recorded in Perth, viz.: 17.2, and the highest in Glasgow. The average rate is given in our statistical table. Diphtheria, including croup and laryngitis, caused 20 deaths, 13 of which were registered in Glasgow. Dundee and Glasgow are the only towns in which measles figure as a cause of death.

PARIS, FRANCE.—The Bulletin for the week ending November 16 shows a total of 1,002 deaths, 256 being under five years. Annual ratio 23.29. Typhoid and typhus fevers caused 120 deaths, small-pox six, measles 11, scarlet fever one, whooping-cough five, diphtheria 27, consumption 175, and pneumonia 65 deaths.

LYONS, FRANCE.—Consul Ben. F. Peixotta reports 158 deaths during the week ending November 11, as against 137 during the previous week; chronic diseases caused the increase, there being no diseases epidemic.

RHEIMS, FRANCE.—Consul John L. Frisbie reports 54 deaths during the week ending November 19; of these seven were caused by cerebro-spinal meningitis, four by diphtheria, and two by measles. "As to cleanliness," says Dr. Frisbie, "the city is kept in the best possible condition, the authorities paying strict attention to such matters."

ROTTERDAM, NETHERLANDS.—Consul John F. Winter reports 10 cases of small-pox during the week ending November 25, but no deaths from the disease. His report states measles to be the prevailing disease.

ROME, ITALY.—Deputy Consul-General Chas. M. Wood reports for the week ending October 29, a mortality of 106, 13 of which were caused by consumption, five by bronchitis, seven by pneumonia, four by malarial fever, and two by dysentery. Mr. Wood states for the information of our people who may contemplate visiting Rome during the coming season that the city is in excellent sanitary condition and that the public health is in every respect most satisfactory.

VIENNA, AUSTRIA.—Consul-General Jas. R. Weaver's report for the week ending November 18 shows 333 deaths, equivalent to an annual rate of 23.4. The deaths under five years numbered 128. Consumption caused 80 deaths, lung diseases 49, scarlet fever six, diphtheria three, whooping-cough six and typhoid fever two deaths.

WARSAW, RUSSIAN POLAND.—Consul Rawicz reports nine deaths from small-pox during the week ending November 11.

BRUSSELS, BELGIUM.—During the week ending October 18 there were 161 deaths, of which four were from typhoid, three from croup, one from whooping-cough, three from puerperal diseases, 25 from bronchitis and pneumonia, and 19 from consumption.

BERLIN, GERMANY.—Consul-General M. S. Brewer reports a death rate of 23.2 during the week ending November 4. Diphtheria and scarlet fever are recorded as prevalent.

ONTARIO, CANADA.—The Health Bulletin of the Province for the week ending December 2, shows the following diseases in the order of area of prevalence: bronchitis, neuralgia, anæmia, influenza, diphtheria and consumption.

CARDENAS, CUBA.—Jas. H. Washington, Vice-Consular Agent, reports the city as perfectly healthy and free from yellow fever.

HAVANA, CUBA.—Dr. D. M. Burgess reports 526 deaths during the month of November, 41 of which were caused by yellow fever, 11 by typhoid fever, five by intermittent and seven by pernicious fever, one by small-pox, one by diphtheria and two by croup. Of the deaths from yellow fever, 11 occurred among civilians and the others (30) in the military hospital. Weather cool and northerly winds prevailing.

GEORGETOWN, DEMERARA.—Vice-Consul J. H. de Jonge reports 162 deaths during October, in a population of 47.175. Croup caused two death, fevers 11, diarrhœa nine, thrush 15, and consumption 25.

RIO DE JANEIRO, BRAZIL.—Deputy Consul-General Jas. H. Murray sends reports for the weeks ending November 4 and 11. Small-pox is the prominent disease on the record of mortality, 75 deaths having been caused by it during the two weeks. The small-pox hospital (Nossa Senhora da Sande) not being able to accommodate the increasing number of patients, the authorities have concluded to establish another on the island of Santa Barbara.

DESTERRO, SANTA CATHARINA, BRAZIL.—The subsidence of the small-pox epidemic is shown by the reports of M. W. Comsett, Consular Agent, for the weeks ending October 9 and 16. Four deaths from the disease are recorded in the former and but one in the latter.

CHOLERA AT MECCA.—Consul General G. H. Heap, Constantinople sends copies of telegrams and reports showing the disappearance of cholera at Mecca. The disease began Oct. 24 and increased until the 31st, after which the deaths diminished in number daily, until Nov. 10, when none were reported. Meanwhile the pilgrims have all departed from Mecca.

FOOCHOW, CHINA.—For the week ending Oct. 28 Vice Consul J. P. Cowles reports no mortality in the foreign community. A summary is given for the year ending Sept. 30 of the work of the hospital and dispensaries for women and children of the Woman's Foreign Missionary Society of the American Methodist Episcopal Church. Physicians: Miss Sigourney Trask, M.D., of Pennsylvania and New York, and Miss Julia E. Sparr, of Indiana and Ann Arbor, Mich. Patients, 2,495; prescriptions, 4,970; surgical operations, 264; visits to out-patients, 1,269; deaths in hospital, one. A new dispensary has been established in the centre of the native city, Miss Sparr in charge. Efforts are being made to add a hospital there—the Governor-General and Chinese officials have subscribed $500 and Chinese merchants $300. The energy of these ladies is to be commended.

SHANGHAI, CHINA.—F. D. Cheshire, Vice Consul-General, sends reports for the three weeks ending Oct. 24, and 31, and Nov. 7. He remarks that a few cases of dysentery have again appeared with a return of mild weather. Cases of malarial fever are less frequent. Cholera is behaving as it does here year after year, sporadic cases cropping up from July to November, and chiefly among seamen.

SWATOW, CHINA.—C. C. Williams, Consular Agent, reports a fatal case of cholera as having occurred during the week ending Oct. 28. Malarial fevers are prevalent. Among the natives eye diseases and leprosy are of frequent occurrence.

MADRAS, BRITISH INDIA.—Consular-Agent Lumisden Strange reports for the week ending Nov. 3 a total of 255 deaths, equivalent to an annual rate of 33.3 per 1,000. Of this number 203 were buried and 52 were burned. Small-pox caused five deaths, measles three, fevers 58, diarrhœa and dysentery 30, and cholera none.

CALCUTTA, BRITISH INDIA.—Consul-General Mattson sends reports for the weeks ending October 14, 21 and 28. The deaths were respectively 253, 284 and 279; giving the annual rates of 30.4, 34.2 and 33.6 per 1,000. The deaths from cholera were nine, 20 and 32. The first of these records is said to be favorable, and the second and third re characterized as being considerably above the average.

In view of the increase of diphtheria in Philadelphia, the attention of school teachers and others is called to the rules of the Board of Health for preventing the spread of the disease, particularly among children.

REPORT ON SMALL-POX IN CALIFORNIA, 1880 AND 1881. By F. W. Hatch, M. D., 16 pp. 8 vo.

This is an extract from the report of the Secretary of the State Board of Health, giving a brief history of the progress of the disease in the State and an account of the quarantine established against it in the fall of 1881. Fifty-one deaths were reported in the State during 1880 as due to small-pox, all cases in the interior of the State having been due to communication with San Francisco. In 1881 seventy-five deaths from small-pox were reported. In September and October the disease was introduced into California by emigrants coming via Chicago.

In November a regular inspection service with vaccination of unprotected passengers was established on the border of the State at Truckee, on the Central Pacific Railroad, and by this some cases of small-pox were intercepted in January of this year. While as a rule inland quarantine against small-pox is not justifiable, since the results do not warrant the expense and trouble, yet in the case of emigrant trains there can be no doubt that these inspections, and the systematic vaccination carried out by their means, have accomplished much good.

CONJOINT SESSION OF NORTH CAROLINA BOARD OF HEALTH and Medical Society of North Carolina, held in Concord, May 10th, 1882. LXVI. Pp. 8vo.

This pamphlet contains an essay on preventive medicine by Dr. W. P. Beall, in which he urges upon physicians the importance of keeping records of disease, and a report by Dr. T. P. Wood, the Secretary of the State Board of Health, of its operations during the preceding year.

This report is made to the State Medical Society, which is, theoretically, the State Board of Health. As the law provides no means, what is done is practically a voluntary contribution on the part of the Secretary, Dr. Wood. The following account is given of the water supply of Wilmington:—

After analyses had shown that the water of the wells was unfit for use, in 1881 a company was organized to supply the city with water, and work was commenced in laying pipes without any announcement as to the source of the supply to be selected. The determination of the source of water was finally submitted to the County Board of Health, which had analyses of the water from the North-east branch of the Cape Fear River made by Prof. Nichols, of Boston, and Drs. Sedaux and Dabney of the Agricultural Experiment Station. Subsequently, during the long continued drought of 1881, analyses were made by Dr. Dabney, showing an undue proportion of chlorine and albuminoid ammonia and an odor of sulphureted hydrogen.

The Board found that the water had produced bad effects upon the mill hands and others at one time, and that in many seasons the water was brackish, and that there was a risk of contamination by sewage, and as the result it declared, "That in the opinion of this Board the water from the North-east branch of the Cape Fear River, as at present tendered to the city by the Clarendon Water Works Company, is not suited or fit for domestic use, according to the evidence presented."

The action of the Board was reported to the Board of Aldermen, but the water was formally received by them from the Company, the opinion of the Board being entirely ignored. Upon this the Secretary remarks "that the financial interests involved so frequently outweighs every other consideration, that it is discouraging to undertake such responsible business as advising public officers in matters appertaining to the public health. It is too often the case that they seek for advice hoping that it will coincide with the schemes they have on hand, deeming it entirely proper to accept or reject it, as suits their convenience."

There will no doubt come a time when the use of this water will produce sickness and death in Wilmington. Then let the citizens bear in mind the names of the members of the Board of Aldermen who have voted to accept this supply in open defiance of the advice of the very authority to which they had referred the matter for decision.

The water department of Harrisburgh, Pa., is waking up to the fact that the officials have some rights which citizens are bound to respect, and have procured from the Common Council a favorable report on the passage of an ordinance, giving the department exclusive control over service pipes and connections with the mains, and forbidding anybody but the "city tapper" to tap the mains.

Pure Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Reliable Food Products.

Great progress has been made, within a few years, in manufacturing food products, and the standard of quality has been raised to a point far beyond that which formerly obtained. We claim that this has, to a considerable extent, been due to our efforts. As the Largest Manufacturers and Dealers in the world in this line, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.,
Importers, Manufacturers, and Dealers in all varieties of Food Products; New York, London, and Bordeaux.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so-called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

Under this head we will insert advertisements, not exceeding four lines, free of charge, for persons seeking employment. This privilege is restricted to persons employed by *Architects, Civil Engineers, Chemists, Electric Light Companies, Gas Companies, Plumbers and those engaged in the business of Heating by Hot Air, Hot Water and Steam.*

ONEONTA, N. Y., *Dec.* 8, 1882.

To the Publisher of THE SANITARY ENGINEER:

DEAR SIR: If there are any plumbers who apply to you for ads. for employment that are single and would go into the country for a steady job, and one who *is temperate*, we would be much obliged to you to give us their address. We want a man who is strictly sober and temperate. We have been bothered almost to destruction with drunken plumbers, and if we can find a plumber who is temperate, would give him steady employment. At the same time we would prefer to find a plumber who can do gas fitting also.

Yours respectfully, M. & G.

[We print this for the information of those of our readers who think they can "fill the bill."]

BY MECHANICAL Draughtsman perfectly familiar with perspective work. Good references.
J. T. C., 43 King St., New York City.

A FIRST-CLASS Plumber with 9 years' Boston and New York experience, wants steady work. No objection to country.
Address, A. K., this office.

AN A-1 Plumber wants a steady job.
Address, F. McC., office Sanitary Engineer.

A JOURNEYMAN Plumber, with 20 years' experience, best N. Y shops, wants a job in either city or country.
Address, M. K., care of THE SANITARY ENGINEER.

A GENTLEMAN, thoroughly familiar with Plumber's Materials, desires a situation with some good house, either on the road or in the office. Can furnish the highest reference.
Address, A. B. C., THE SANITARY ENGINEER Office.

WANTED:—Young man with two years' experience at Engineering and Draughting, college graduate science department, desires situation as Assistant Engineer, Surveyor or Draughtsman, or sit with Architect or in similar employment. References.
Address, B. F. CHANDLER,
Boston, Mass.

A JOURNEYMAN Plumber, with 16 years' experience, wants work in or around New York.
James Hagan, 535 Washington St., N. Y.

A JOURNEYMAN Plumber of 12 years' standing, wants work in or near New York City. Address,
Jno. Stanton, 179 W. Houston St., N. Y.

PLUMBER wants situation, city or country. Only left last place Nov. 18th. Refers to Bixby & Woods, Conncil Bluffs, Iowa, also parties in this city. Address, T. P., Office Sanitary Engineer.

DESIGNER and Mechanical Draughtsman desires engagement. Thoroughly acquainted with Process work, also Architectural and Engineering work. Louis C. Denis, Jr., 291 Pearl St., N. Y.

A COMPETENT Sketch Artist desires employment. Prefers some city engagement.
Address, W. H. S., this office.

A PRACTICAL Steam Fitter of 27 years' standing seeks a position. Address, Jno. Hughes, 315 10th Av., N. Y.

A STEAM Fitter, who has been in the business 15 years, wants a situation. No objection to going out of city.
Francis Boyle, 158 W. 28th St., N. Y.

A DESIGNER and Mechanical Draughtsman, (who is also familiar with sketching for engravers), desires a permanent position.
Address, Designer, 78 Day St., New Haven, Conn. (Ca. S.)

VOLUME IV.—Bound in cloth, with Index, issues from Dec. 1, 1880, to and including Nov. 15, 1881, - - - $7.00

VOLUME V.—Bound in cloth, with Index, issues from Dec. 1, 1881, to and including May 25, 1882, - - - $4.00

VOLUME VI.—Bound in cloth, with Index, issues from June 1, 1882, to and including Nov. 30, 1882, - - - $3.00

☞ *Sent by Mail. Postage 40 cents.* ☜

They can be supplied in London, by our Agents, Messrs. E. & F. N. Spon, 16 Charing Cross.

The following back numbers of THE SANITARY ENGINEER are worth preserving, and will be sold at prices quoted until further notice:

February, 1878..... 50 cents.

Contains an article on "Plumbers' Profits." Useful when a plumber's bill is disputed, as showing what percentage of profit is necessary and legitimate.

April, May, June, July ... ... } for the set $1.00
and October, 1878..... } or 20 cents each.

These issues contain articles from E. S. Philbrick, C.E., on "The Ventilation of the Public Sewers;" Robert Briggs, C.E., on "Heating and Ventilation," and Col. Geo. E. Waring, Jr., on the "Sanitary Aspects of Plumbing."

December, 1878, and January, 1879.....each 30 cents.

Article on the Electric Light, by Prof. Henry Morton, President of Stevens' Institute of Technology, "Terms of the Competition for Improved Tenement Houses." Articles on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., "Ventilation of the Capital at Washington," by Robt. Briggs, C.E. "Sanitary Condition of Tenement Houses," and Irvington Sanitary Survey," by Col. G. E. Waring, Jr.

March, 1879..... .....$1.00

Contains "Prize Plans in Tenement House Competition," with report of Committee of Award; a history of the movement which led to the passage of the Tenement House Act in New York.

March, April, May, June 1 and 15, and July 1, 1879, only a few left.....for the set $4.00

This series contains the ten selected plans on the "Model Tenement House Competition."

May, 1879.... ..... 50 cents

Has article on the "Holly System of Steam Heating," by Robt. Briggs, C.E. Article on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., and seventh and eighth "Prize Plan in Tenement House Competition."

August 1, 1879..... .....30 cents

"Plan and Description of a Model Paris Apartment House," by Lewis W. Leeds. Article No. 3 on "Domestic Sanitation," by E. S. Philbrick, C.E.

September 1 and 15, October 15, November 1 and 15, 1879..... .....each 30 cents

In this series is an illustrated description of the "Heating and Ventilation of the Utica Insane Asylum;" article on "Food Adulteration Abroad," by Prof. Henry Morton; "Domestic Sanitation," by E. S. Philbrick, C.E. Articles on "Water Gas—Its History and Manufacture," by Prof. Henry Morton, Ph.D. "Sanitary School Construction," by Dr. D. F. Lincoln; an opinion on the "Validity of the McCloskey Patent," by J. N. McIntire, Patent expert.

March 1 and 15, April 15, 1880.....each 50 cents

Valuable, as they contain results of "Model School House Competition," with report of the Committee of Award, and eight of the Prize Plans.

May 1 and 15, 1880..... ....each 50 cents

Very valuable for reference, as they contain full report (illustrated) of Dr. Carmichael, of Glasgow, on his experiments to test the liability of sewer gas and disease germs to pass through a water seal trap. Often referred to.

October 15 and November 1, 1880... .....each 50 cents

An account of the "Heating and Ventilating Arrangements of the Madison Square Theatre;" "How to Utilize Exhaust Steam to Heat a Factory" (Illustrated). "English Adulteration Acts," by G. W. Wigner, F.C.S. An illustrated description of the Sewerage of Memphis.

December 1, 1880..... ... 50 cents

Contains report of the Committee of Award in the "Food Adulteration Competition;" an article on "Recent History of Electric Lighting," by Prof. Henry Morton. A review of schemes for the sewerage of Newport, R. I, "Arsenical Wall Paper," by Dr. E. S. Wood, of Harvard Medical College.

May 15, 1881.....50 cents

A Review of Prof. Pumpelly's report on the filtering capacity of soil; an article on the "Safety of Theatres," by Jas. Harrison, Superintendent of the Board of Fire Underwriters, N. Y. A plan for removing ground water from a city house to the sewer (illustrated). A sectional plan of fitting up a Double Hot Water Boiler, as done in New York.

August 1 and 15, and September 1, 1881.....each 25 cents

Contains letters and articles giving full account of the system of Disposing of Refuse and Sewage at Birmingham, England.

October 1 and 15, and November 1 and 15, 1881....., ...each 25 cents

Review of Col. Waring's article in *Scribner's* on the "Drainage of New York." Article No. 1 on the system of "Water Waste-Prevention in Liverpool." Plan and description of a Sewer Weir and Geometrical Stair Case, designed by Sir Jos. Bazalgette, London; the Municipal Chemical Laboratory of Paris, by Dr. De Pietra Santa.

Address, BOOK DEPARTMENT, THE SANITARY ENGINEER,

P. O. Box 3037, 140 William Street, New York.

Proposals.

GOVERNMENT HOSPITAL FOR THE INSANE,
WASHINGTON, D. C., *Dec.* 5, 1882.

Proposals for laying a water main from Washington, D. C., to the Government Hospital for the Insane across the Eastern Branch of the Potomac River.

Sealed proposals are invited for laying an eight-inch water main from the grounds of the Washington Barracks at Greenleaf's Point to a point on the grounds of the Government Hospital for the Insane. Further particulars and profile of the river can be obtained by addressing the undersigned. Proposals should be sealed, marked "Proposals for laying water main," and addressed to the "Superintendent of the Government Hospital for the Insane, Washington, D. C." All proposals received will be opened at noon, January 4, 1883.

The right to reject all bids is reserved.

W. W. GODDING, *Superintendent.*

PROPOSALS FOR GLASS.

OFFICE OF SUPERVISING ARCHITECT, TREASURY DEP'T.,
WASHINGTON, D.C., *Dec.*, 14, 1882.

Sealed proposals will be received at this office until 12 M., on the 28th day of December, 1882, for furnishing and delivering, ready for fixing in place, all the Plate, Double-thick Sheet; Double-thick Sheet Ground Cathedral and Enamelled Sheet Glass, required for the Custom House, Court House and Post Office at *Albany, New York*, in accordance with specification, schedule and dragrams, copies of which and any additional information may be had on application at this office or the office of the superintendent. JAS. G. HILL,

New York.

Illustrated Circular sent on application.

SYPHONAGE OF TRAPS.

COL. WARING'S DEDUCTION FROM HIS EXPERIMENTS.

"The water under strong suction was entirely removed from Nicholson's Trap, *but its mercury was not and evidently* COULD NOT BE DISTURBED."

Extract from the report of WM. PAUL GERHARD, Esq., Sanitary Engineer to the *State Board of Health* of Rhode Island, 1882. In speaking of this trap, he says:

"*The mercury seal very effectually prevents the entrance of sewer air, even if the water in the cylinder should be removed by syphonage or evaporation.*

Can be seen in operation at our New York Warerooms.

Thomas Maddock & Sons,

MANUFACTURERS OF

Sanitary Specialties in Earthenware,

Besides all the staple wares for Plumbers' use.

All our goods guaranteed Equal to the Best Imported Ware.

☞ *Send for Circular.*

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

STEWART'S PAT. VENTILATING TRAPS

IN STONEWARE AND IRON.

Simple in construction. No Valves to get out of order. Automatic in action. Cheapest and best ever introduced. One placed as an INTERCEPTOR between house and street sewer, or Cesspool, will positively exclude foul air from any house. *WE GUARANTEE THIS.*

Price Lists and Testimonials mailed by STEWART & CO., MANHATTAN POTTERY, foot of West 18th & 19th Streets, and 312 Pearl Street, cor. Peck Slip, New York.

RECENTLY PUT INTO THE WHITE HOUSE BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 Superior Street,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL S TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings

A valve and proper ventilation is indispensable. With front ven sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

Salt-Glazed, Thoroughly Vitrified

Sewer and Drain Pipe,

THE

RIDER COMPRESSION

PUMPING ENGINE,

(Hot Air),

For city or country residences where it is required to raise a supply of water, is the most *Perfect Pumping Machine* in the market. Its marvellous *Simplicity*, absolute *Safety*, great *Economy* and *Effectiveness*, render it far superior to all others. Can be run by any inexperienced person. Send for catalogue and price list to

CAMMEYER & SAYER,
93 Liberty St., New York,
and 20 W. Lake St., Chicago, Ills.

Please mention this Paper.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220
Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275
Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375
Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration.

Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

The "EUREKA" Wheel Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which in other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.
The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.
The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.
Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street,
PHILADELPHIA, PA.

Over 100,000 *now in use!*

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

BOYLE'S PATENT

Tidal Wave

WATER CLOSET.

Patented in all principal countries.

SECTIONAL VIEW.

A—Air Pipe. C—Supply Pipe.
B—Flush Pipe. D—Vent.
E—Connection for Fresh Air Pipe.

A New Departure in Water Closets.

The closet is made of one piece of earthenware, and supplied with Waste-Preventing Cistern coming under the lowest rate of taxation, as adopted by the Department of Public Works of New York.

Wherever in use, the closet has given entire satisfaction, and is recommended by leading authorities on sanitary matters as coming up to the requirements of a first-class appliance of its kind, being

Simple and Positive in Operation, Clean in Use and Perfect in a Sanitary point of view.

CREQUE'S PATENT

New Circulation

RANGE BOILERS

13 different styles—adapted and warranted for every possible situation.

ESSENTIAL FEATURES.

1st. Cold water is introduced at the bottom of the boiler, while hot water is injected into the top of the boiler.

2d. By this system the chilling of the hot water in its passage to the top of the boiler is avoided.

3d. Hot water being stored at the top of the boiler without chilling, it can be used immediately; thus making the boiler serviceable as soon as the water-back is heated.

4th. The circulation is positive in direction and rapid in action, and heats in very much less time.

5th. Circulation being positive, there is no cracking, snapping or rumbling in the boiler.

6th. There being no reversal of circulation, there is no sudden expansion and contraction of the boiler shell. The boiler will therefore wear longer.

7th. In case of a part of the boiler being filled with steam, a sudden injection of cold water does not condense it, as the injection is at the *bottom* of the boiler, thus forcing the heated water above it to fill the space left by escaping steam, when a hot water cock is opened.

8th. A considerable saving in material and labor in cost of setting up the boiler and connecting pipes.

9th. In consequence of a rapid, invariable and constant circulation, much more hot water can be obtained from a small sized boiler than from a much larger boiler of the old method of circulation. These boilers are arranged to meet every conceivable requirement of location or condition. To both the plumber and architect this is a great advantage, while it also lessens the cost to the builder.

N. B.—Please send for Catalogue fully explaining the various situations for which these boilers are intended.

For Sale by Dealers in Plumbers' Supplies.

Every Subscriber should have one of our neat BINDERS to preserve the copies of THE SANITARY ENGINEER for future reference. Price, $1.00. Postage paid.

A MODEL SLOP SINK,

IN ONE PIECE OF EARTHENWARE.

When set on and surrounded by White Glazed Tile, as shown, it makes the cleanest and most useful Slop Sink arrangement we know of.

It is provided with a Flushing Rim similar to the Hellyer Hoppers.

It is sold with the Flushing and Water Supply apparatus, that is made of Brass Pipe, as illustrated, or with a set of Combination Cocks to attach to Lead or Iron Pipes that may be concealed behind the wall.

It is arranged so that no overflow can take place when a pail may be set over the outlet hole and the water carelessly left running.

Persons wanting some such thing will find it worth while to take the trouble to call at our warerooms and examine it.

The apparatus complete, as shown, we designate as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 40.

When the Combination Cocks and the Hoppers only are wanted, it is designated as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 41.

We have fitted up Show-rooms at No. 1 Pemberton Square, Boston, where our specialties can be seen. Persons living in Boston and vicinity are invited to call and examine them.

We have fitted up in our warerooms the various styles of Water Closet Apparatus that are to be taxed in this city $2.00, $5.00, $10.00 and $20.00 per year respectively. Architects, Plumbers, and Householders who may be interested, can there see which arrangement is best suited for their particular needs.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

THE WATER SUPPLY OF AMERICAN CITIES.

The question of supply of water to our large cities, including their suburban towns, is becoming more and more serious every day. The cities themselves are but the nuclei, the business centres of great masses of people whose daily avocations require their presence in the immense hives of buildings which are congregated in a small compass, but whose families live, and they themselves sleep, miles away in every direction to which means of rapid and frequent transportation are afforded them. The tastes and customs gratified in their luxurious business offices and in the dwellings in the fashionable quarters, are carried to remoter residences, and among these a lavish use of water is the most common and the one whose absence is most severely felt.

Most people cannot be made to understand that water in the house to be used at will is in reality an expensive luxury, and not only so, but that it is a difficult one to provide on a large scale. To supply the population which transacts its business in New York city, about two milion people, the entire available rainfall on at least two hundred square miles of territory would have to be stored and dealt out piecemeal, so to speak. That is to say, two hundred square miles of land must be kept free from polluting occupancy, large and expensive storage basins constructed on it and watched and tended with scrupulous and intelligent care, that the dwellers in the metropolis may have barely enough water for their needs. Practically more territory than this is required, for it is hardly possible to either so rigorously utilize the rainfall, or so rigidly enforce moderation in consumption. We will revert to this subject again very soon, and more in detail than we can at this time. The question is almost appalling in its magnitude and in the seriousness of the considerations of the comfort and even the existence of the dwellers in great cities, which are involved in the procuring of a sufficient supply of water for their use. New York, Philadelphia, and Boston are now seriously incommoded for water. Some of their suburban towns have outgrown the supplies which not long since they had procured and which were thought to be ample for many years to come. As the extension of the central city includes the suburbs and they are annexed one by one and form one community, the problem becomes more and more complicated and its solution difficult, under existing modes of administration where political services rather than professional knowledge and skill are made the requisites for office holding. If there is any one branch of municipal government in which a reform of method of appointment and tenure of office is needed more than in others, it is what may be termed the scientific branch, and particularly the hydraulic division of that branch. No engineering works can be safely or economically entrusted, whether as regards their design, their approval, their construction or their management to elective bodies or bodies appointed only for services to a political party.

Of the three great cities we have named, Philadelphia easily bears off the palm for inefficiency of organization. New York is next, and Boston, though in better condition, is still in bad plight. It is greatly to the credit of the present executive of the Philadelphia water works that under adverse circumstances, and hampered and obstructed by a Board of Aldermen who cannot be made to see the necessity of providing in advance for emergencies, he has been able to increase the efficiency and reduce the relative expenditure of operating the collection of odd machinery under his control. His reward is a caucus resolution to supplant him. Of New York we shall take occasion to speak at another time. In Boston the efforts of the water board to postpone the time of actual suffering for water, by the adoption of methods of repressing waste which have stood the test of experience, have been unsuccessful owing to the stupidity or something else of the aldermen. The "government of the people, by the people, for the people," is pretty in theory, but bad in practice as far as it is attempted to let miscellaneously elected aldermen order or forbid the expenditure of funds regardless of the experience of skilled men. A well defined plan of operations prepared by men who have made the procuring of water works' knowledge a special branch of their business, and a strict adherence to that plan, is the only basis for a well regulated management of the daily routine and the needed extension of works for water supply anywhere.

FOOD AND DRUG STANDARDS.

We print in another column an interesting and suggestive letter from Mr. Henry B. Parsons, in which he urges the importance of an early publication of standards and methods employed by the analysts of the State Board of Health in carrying out their work under the food and drug law of this State.

For the majority of drugs and officinal preparations, such standards and methods are already fixed by the Pharmacopœia, and for many other preparations the standard is simply what they claim to contain. In these last, however, and in most articles of food, variability must be allowed within certain limits, and these limits should be well known to the public. The fixing of these standards and the selection of the best methods of analysis requires much highly skilled labor, and is, therefore, expensive. At present this cost must be incurred by each State, unless it chooses to wait for and accept blindly the results obtained and published by some other

Digitized by Google

State, and it is for this reason that it appears to us so highly desirable that there should be a national food and drug adulteration law, and that the General Government should assume the responsibility and cost of fixing standards and methods for all the States.

If the United States selects proper men to prepare these standards, and it is not difficult to provide the means of doing this so as to avoid the influence of politics, there is little doubt that the results of these works would meet with general acceptance, and that the uniformity so essential to the interests of the manufacturer, would thus be secured.

The information that the Board of Health of this city are beginning vigorous measures against violators of the plumbing law raises the question whether the time has not now come for the Master Plumbers' Association to act on Prof. Chandler's suggestion and determine what shall constitute membership in full and regular standing in the association. The question to be met is simply this, whether in view of the unpleasant notority these prosecutions will give the craft, unless its position toward skin work is unmistakably declared, the interests of the Association do not require them to draw up a code which will exclude flagrant violators of the law from membership. Sooner or later the question will have to be met by plumbers, just as it has had to be met by doctors and lawyers. Self protection will require it of them, and this is a good time to begin. How the Association should proceed we will not, at this time, undertake to say. But it occurs to us that as a starting point a standing committee on conditions of membership, composed of the most reliable members of the association should be appointed to investigate what the qualifications of membership should be, and what the delinquencies which shall be followed by expulsion from the association. Such a committee should report within a reasonable time and thus bring the whole matter in a compact shape before the Association, which would then have something definite before it to act on.

We do not expect that a reform of this kind can come in a day, or without opposition from certain members, but something of the kind will have to come. The trade of a plumber is every day seen to be closely like that of a pharmacist or even a physician in its intimate connection with the public health. A plumber can no more be permitted to work just as he chooses without regard to sanitary principles, than a pharmacist to blunder in putting up prescriptions, or a doctor to practice without knowledge of medicine.

All that need be said in conclusion is that the very demand for this plumbers' "code of ethics" is going to raise the standard of the trade by elevating it to the grade of a public business or profession, conducted with some regard to the public interest and the reputation of those who follow it as a calling.

The first serious blow-out in the steam pipes in the streets of this city, happened on Tuesday afternoon of last week at the corner of Nassau and John streets. The break was in the American Heating and Power Co. apparatus, and was not caused by an excessive pressure, as many seem to think; the pipe used being standard and normal and capable of withstanding a very much higher pressure than the supplying boilers would be subjected to.

The part which gave out was a corner which had been giving some trouble for a few days, and was previously *soft-p tched*—that is to say, had a clamp put on it filled with some loose material which could be pressed in—to stop a leak, caused, perhaps, by a defective fitting, but which we assume was the result of uncompensated expansion of the metal of the pipes where they formed a bow to get over some obstruction to their direct course.

A blow-out of this kind must be dangerous to those who are very close to it, and must cause inconvenience to the public and consumers, but never can be attended with results similar to a boiler explosion, nor can the streets be ripped up for any length, the break being confined to the fitting, or thread on the pipe, and never splitting a pipe its whole length. There is also less danger from a bursting steam pipe than from the return water pipe, should it give out. Escaping steam, even though it comes from a large pipe, expends its force in a few feet, and unless one is directly in its course, and very close to it, will not be scalded; but with hot water escaping under pressure it is different; the water may be thrown to a great distance, and will penetrate clothing and parboil the unfortunate persons in its way before they can get relief, as the water will retain its heat until cooled by contact with something colder than itself. The reduced size of the hot water pipe compared with the steam pipe is in its favor, but of the two, the broken return pipe will be the most dangerous.

The departure from the common arrangements of the heating and ventilation of similar buildings, which Mr. Warren Briggs introduced into the Bridgeport High School, has made that building an object of much interest to the specialists in school construction. Since its occupation for school purposes last October it has been frequently examined, and, on the 21st inst., was thoroughly tested by Dr. D. F. Lincoln, the School Board, and other gentlemen, who were present by invitation for the purpose. We shall hereafter publish a report of the tests from the notes of our representative who was present.

DR. DOUCIT ON SEWER GAS.

We have received from Mr. T. O. Daley a note stating that, having observed our remarks that we should like to hear from Prof. D. D. Doucit (see SANITARY ENGINEER of Dec. 7th, '82, page 8) he had written him to that effect and received in return a communication which he took pleasure in forwarding. We print both of the enclosures contained in Mr. Daley's note, although we have some doubts as to whether the first one was not sent to us by mistake. Mr. Daley does not favor us with either his own address or that of his friend, but as he evidently reads the paper we will say that we would prefer to have some of Prof. Doucit's experiences as member of a board of health rather than any formal essays like the one which he has prepared for us.

PODUNK, *December* 16, 1882.

DEAR TIM: I got your note telling me that the SANITARY ENGINEER wanted to hear from me, and I have written the Editor a paper on Sin and Sewer Gas, which I enclose for you to forward. I hope it will suit him; but you can't mostly always sometimes tell about these editors. *I've been one myself.* Who is the Editor of the SANITARY ENGINEER anyhow, and what is his little game? I've made a pretty good thing out of hygiene, but not half as good as it might have been if other people had not stolen my ideas. The way I have been robbed is simply shameful. You remember how I got scooped in my National Health business. The National Board of Health tried to carry out my plan without consulting me, and a pretty mess they made of it. Why just look at the chance they had. Five hundred and fifty thousand dollars given them the first year!! And what did they do? Spent about one quarter of it and then expected to receive the rapturous approval of Congress for their economy!!! I tell you when I saw this in their first report it made me sick.

Why didn't some sensible man whisper in their ears in thunder tones to spend the whole of it. No doubt they see their folly now. Then see what a chance they had in the disinfectant business. Why they might have made five thousand dollars apiece as well as not.

I *know*, for I sent them a sample of one of the loveliest disinfectodorizers you ever saw—would take the smell out of a Philadelphia sewer contract in three minutes—and offered to go shares. And what do you suppose they did? Sent it to a chemist and published his analysis showing that it cost two cents a pound and was sold for fifty!

However it's no use crying over spilt milk.

But about this SANITARY ENGINEER. Is it a genuine thing, or only one of the regular old windmills—and if the latter, what grist is he trying to grind? I've not been in the sanitary line exactly for the last three or four years: part of the time I've been managing a patent fertilizer, and the rest has been taken up with the mineral water business and St. Judas's Oil; but if your friend wants some of the experiences of a veteran sanitarian he shall have them—for a consideration of course. If he will let me write a half column editorial notice of the oil for one issue I'll give him some inside views of a board of health that will be instructive.

Yours in haste, D. D. DOUCIT.

SIN AND SEWER GAS. SAFETY TO SOCIETY SOLELY FROM SANITATION. (Let this heading be well displayed—take the Chicago *Times* for a pattern).

Euphoristicus, the Dorian sage, taught that all diseases enter at the nostrils. Had he lived in this great and glorious country he could have found abundant proof of his belief. The investigations of distinguished modern philosophers prove that we are all being poisoned by sewer gas and that the race is rapidly being doomed to extinction. But frightful as it is to contemplate the ravages of diphtheria, ecthyma, dacryocystitis, microsporon and the thousand other ills caused by that demon lurking in our stationary washbowls, etc., I have to sound the note of warning of a still more terrible danger from the same cause. For the last year I have observed a deterioration, slight it is true, but still distinctly perceptible, in the moral tone and character of my brother-in-law. He has become sceptical and uncharitable, and seems to rather take pleasure than otherwise in the troubles of some of his best friends. This change dates from his occupancy of a fine new house fitted with all the modern conveniences. I persuaded him, a few days ago, to let me make a minute inspection of the drainage of this establishment. I found he had nothing but common water traps in the house and the sewer gas was being absorbed on one side of these and pouring up into the house in dense clouds on the other. I warned him of his peril, but it was not until I got home that I realized the astounding importance of the discovery I had made.

Where is it that sin and crime are rampant? In sewered cities. Where is it that political jobbery is most complained of, that savings banks collapse and cashiers elope, that pickpockets congregate and drunkenness abounds? In the sewered cities where the skin plumbers do congregate. And then I saw that this conflict between Religion and Science that the papers have been discussing is nothing to the conflict between morality and sewer gas.

[We consider the above a sufficient sample of Prof. Doucit's style and omit the rest for want of space. On the whole we prefer his letters.—Ed. SANITARY ENGINEER].

VIOLATIONS OF THE PLUMBING LAW.

Our recent public exposures of gross violations of the plumbing law and the subsequent vigorous action of the Board of Health in dealing with "skin" plumbers seems to be having a good effect. No serious cases were reported last week, and but few trivial ones, as follows: By Inspector Hooper, five; by Inspector Hollick, two; and by Inspectors Eagleson & Golden, one each.

Plumber John F. Crotty was arrested on the 23d inst., for the work on Alexander avenue, which we described two weeks ago. He waived examination and gave bail to appear before the Court of Special Sessions. Plumber McDougal, whose arrest we noticed last week, also gave bail at a preliminary hearing on the 23d.

The State Board of Health has commenced prosecutions against the following persons for selling adulterated foods: C. Sinnigen, 1002 Second avenue; S. S. Steiermann, 926 Second avenue; and P. Greifenstein, 833 Second avenue; for selling mustard containing flour, which was not sold as a mixture. John O'Connor, 838 Tenth avenue, plead guilty to the charge of selling coffee adulterated with chicory. He stated that he did not know it was an offense. The cases will come up for trial at the Court of Special Sessions.

The trustees of the public school of Asbury Park and the Board of Health have united in adopting a plan to prevent any child who can convey a contagious disease from attending school. The principal reports all cases of absence due to sickness of contagious character to the Board of Health. The Board of Health then, at their discretion, direct the principal to exclude all pupils affected with the disease or coming from the same family for a period fixed by the Board of Health.

SANITARY ARRANGEMENTS IN THE RESIDENCE OF MR. CORNELIUS VANDERBILT.

(Continued from Page 4.)

V.—Housemaids' Sinks.

In enumerating the fixtures in the basement, two wash-hand basins in retiring rooms adjoining the billiard room were not mentioned. Both have 2-inch waste pipes and 2-inch air pipes from the crowns of the traps. The hot and cold water supply pipes are ½-inch brass, and on each is an air chamber consisting of about two feet of 1-inch brass pipe.

The fixtures remaining to be described form one of the most interesting features in the plumbing of this house. With the exception of that in the servants' bath room, on the fourth floor, all the housemaids' or slop sinks are in a single vertical line extending from the basement to the third floor, and occupying the well-hole of the servants' stairway. Fig. 1 is a front elevation of the sink on the second floor and the connecting pipes, as they appeared before the marble slabs were in place.

The sink is of enameled iron. The outlet is through a grated opening in the centre of the bottom, eight inches in diameter, into the top of a funnel-shaped connection with the 4-inch lead waste pipe *a*, having a 4-inch cleaning screw *b* in the safe over the crown of the trap. A 2-inch lead pipe *c* leaves the side of the waste pipe a few inches beyond the trap and enters the 3-inch iron air pipe *d*, which receives the branch air pipes from all the other traps on this line, and enters the 5-inch soil pipe *e* above the highest branch. The safe waste *f* is 1¼-inch galvanized iron, connecting with a vertical pipe *g*, of the same size, to which branches from all the other safes of this line are connected, and which ends over a sink in the cellar, being trapped at its lowest end, like all the safe wastes, by a loop in the pipe and a valve, as shown in The Sanitary Engineer of April 27, 1882 (Vol. V., p. 460). From the funnel-shaped iron connection, between the sink and the waste pipe, is taken a 2-inch lead pipe *h*, which is connected with a 3-inch galvanized iron pipe *i*, which is in turn connected with a larger galvanized iron pipe *k*, for the purpose of ventilating the space above the trap. The main pipe, *k*, starts at three inches in diameter from the lowest sink and increases in size just above each branch, reaching a diameter of six inches above the highest sink. It is not connected with a heated flue nor has it other means for causing an upward draft, except a common ventilating cap on its end above the roof.

The water supply to this sink (on the third floor) is from both the street and tank pressure, as explained by the following index to the letters on the smaller pipes in the drawing. All these pipes are of brass. The main line of street pressure, cold, for these sinks alone, is one inch in inside diameter and marked *l*; the branch to the faucet is l_1, which is ¾-inch. The corresponding pipes *m* and m_1, on the other side, are from the tank. Both are connected with the same faucet by stop cocks. In the same way the street-pressure hot (main line one inch and branch ¾-inch), marked *n* and n_1, and the tank hot, *o* and o_1, are connected with the other faucet. The latter have return circulation pipes (½-inch) *p* and p_1, and *q* and q_1. There are air chambers on both hot and cold supplies, consisting of brass pipes one inch in diameter and about two feet long.

Figure 1. Front Elevation of Housemaids' Sink with Connecting Pipes.

Figure 2. End Elevation of Sink with Waste and Ventilating Pipes only.

Fig. 2 is an end elevation of the sink, and waste and ventilating pipes alone, to show that part more clearly. The same letters are used for the same pipes as in the larger drawing.

The safes and the single floors which they cover are the only divisions between successive sinks, so that the traps and pipes of the sink above are seen at the top of the closet enclosing the next below. The space under the sink and above the safe is not accessible except by unscrewing the wooden casing in front. Wooden doors slide down in front of the sink, hiding it entirely when not in use.

SCHOOLS IN RELATION TO INFECTIOUS DISEASE.

The London *Practitioner* of November last contains a good paper on School Attendance in its relations to outbreaks of infectious disease, by Dr. David Page, Medical Officer of Health to the District of Westmoreland, who very truly says that "in a large majority of cases there is a risk of undue prominence being given to school closing, to the subordination and practical neglect of those other measures which are more peculiarly the preventive weapons of efficient sanitary organization." "The exceptional cases in which the closing of a school is a matter of necessity are of two classes—first, those in which the school itself has clearly become a centre or starting point of infection; and second, schools existing under circumstances difficult of control. In the first case it is only necessary to close the school for such time as is necessary to secure thorough disinfection and purification, which usually will not require more than a week or ten days. Schools of the second class belong more especially to rural districts, and the causes for which these closures become necessary are usually scarlet fever or diphtheria. In the management of boarding-schools and similar institutions, every thing depends on dealing promptly with the first cases of sickness.

"In ninety-nine cases out of a hundred, the history of the introduction, say, of scarlatina into a boarding-school, is the return of a boy after the holidays, with the fever in his system. In a day or two the disorder declares itself, and then is the time for proving the necessity as well as the value of isolation. Every school of this class ought to have a sanitarium, or detached house, in constant readiness for such emergencies. Not only should the boy, his clothes, and his bedding, be forthwith removed to such a place, but his next companions should be kept under observation and apart from the rest of the school, as it is amongst their number that subsequent cases, if any, will appear. In large public schools where the boys are located in several houses, the isolation should extend to the whole of the house in which the first case has broken out. These precautions may appear somewhat strict to those who have had no experience of outbreaks of fever in public institutions, but my acquaintance with the results, painful, annoying, and costly, of their neglect, has convinced me that the utmost practicable precautions—and these cited are practicable enough—that can be taken at such a time can err only on the side of laxity.

"In the event of an outbreak of fever in a boarding-school, no boy should be suffered to return to his home until after a term of isolation, equal to the maximum latent stage of the disorder.

"The circumstances which may be held to justify the continuance of day schools during the prevalence of scarlatina, are those wherein the children would be otherwise exposed to much risk in playing about the doors, with children belonging to infected families, and chiefly with children barely recovered from illness. Under these circumstances, always provided that due supervision over infected families is maintained, a child runs less risk in regular attendance at school. This is particularly true in regard to town and village schools, as distinguished from the smaller schools of scattered country districts, where the children coming from all points and from considerable distances are brought together only during school hours. In these latter, the breaking up of the school during prevalence of scarlatina, is, in my experience, the best and safest course."

CIRCULATION OF SEWER AIR.

The difficulties in the way of judging of the circulation of the air in sewers from a purely theoretical standpoint, together with the importance of this subject, has led several gentlemen in Munich to make actual examinations in sewers of the town under varying conditions. The causes affecting the circulation are so numerous, so changing and often even indeterminable, that a practical investigation of results seemed to them to be the only satisfactory and reliable way of obtaining safe conclusions. The first observations were made by Rozsahegyi * during the summer months of 1880.

Dr. Soyka has extended the experiments during the winter months of 1881 to 1882, and his results, together with a comparison of the two series, have lately been published.†

* See SANITARY ENGINEER, Vol. IV., page 401.

† *Zeitschrift für Biologie*, 1882.

The more important conclusions arrived at by Rozsahegyi were that in summer the flow of sewer air was much oftener downwards than upwards, and was more rapid in sewers of lower than in those of higher districts. The direction of winds had no perceptible influence. The difference of temperatures between the air in the sewer and the street would not explain the directions of the current, which seemed to be controlled more by the flow of the sewage.

Dr. Soyka's experiments were confined to the same sewers, but made on very cold days. As the two series give a very instructive collection of actual facts, we shall now present them more fully. The method of observing was as follows: After entering the sewer the man-hole cover was closed so as to preserve the usual condition. The temperature of the air outside and inside and of the sewage was noted. The humidity of the sewer air and the quantity and depth of sewage were likewise recorded. The circulation of air was measured in quantity and quality. In quality, by observing the directions in which smoke from small torches was carried away at different parts of the cross-section and at house and other connections; in quantity by measuring the currents with very delicate anemometers. The intensity and extension of gases artificially introduced, was tested at important points. Sulphureted hydrogen was used for the purpose, and developed in the sewer by placing some sulphuret of iron in a large basin supported at the centre of the sewer, and pouring acid upon it when ready for the observation. The reaction was obtained on sheet lead held at various distances. The hours selected for the work were from nine to one o'clock and extended over 16 days.

The sewers themselves, four in number, are briefly described as follows, in metrical measure.

1. The sections varied from 1.2 × 0.8 to 1.5 × 1.00; the length was 567 metres and the grade 1 : 1000.
2. The section was 2.04 × 1.16; the length was 400 metres, the grades 1 : 755 and 1 : 710.
3. The sections were 1.5 × .84 and 1.47 × .82; the length 550 metres, the grades 1 : 1,000 and 1 : 520.
4. The section was 1.64 × .79, the length 300 metres, the grade 1 : 63.

The results are recorded with great detail together with all the conditions that were supposed to have any influence on the movement of the sewer air. As it would require considerable space to enter into the minutiæ of Soyka's interesting and valuable work, we shall give our readers only the gist of his discussion upon them and his conclusions.

After stating the experimental results he enters very fully into an examination of the forces affecting the circulation of the air in sewers.

In the first place, he touches the influence of the winds. It is found that, while a strong wind blowing into the sewer outlet can undoubtedly cause an upward current, the effect is confined only to a short distance, owing to the open man-holes, which prevent an excess of pressure and to the exhausting power of winds when passing over the gratings.

The second examination pertains to the specific gravity of sewer gases, which is dependent on their chemical and physical properties, their temperature and the pressure under which they are held. A careful and exhausting inquiry is made with reference to the assertion that because sewer air is usually saturated with moisture and therefore lighter specifically, than the atmosphere, it must rise in the sewers. Dr. Soyka clearly shows that the changes of weight caused by the usual differences of temperature between the air in the sewers and outside and by the greater amount of carbonic acid in the former, make this theoretical supposition appear quite insignificant and of no practical value. Again, it is asked whether the admixture of other and lighter gases could not reverse this result, and it is found that in properly designed and flushed sewers very few gases were noticeable. The largest contingent by far is furnished by carbonic acid; besides this only ammonia and sulphureted hydrogen need to be considered. The former is lighter and the latter heavier than air, so that they tend to compensate each other, and their small quantities will not materially affect the increase of weight due to the carbonic acid alone.

No perceptible influence was found to be due to a difference of barometric pressure at the lower and higher ends of the sewers, on account of the ventilating man-holes which at once could compensate any effects.

The influence of the difference of temperature is inquired into very minutely under varying conditions, such as a sewer being open only at both ends, or having perforated man-holes in addition. The results show this influence to be a factor of considerable force. It is found to be reduced considerably from its theoretical magnitude by the uncertain friction at turns, junctions and changes of sections, and its effect is even often reversed by untrapped house drains, especially during the winter months.

Another factor affecting the circulation of sewer air is the flow of the sewage. Experiments were made with a small pipe two inches in diameter, as well as in the sewers. The influence was found in all cases to increase with the velocity of the water, with its relative height and breadth of surface; yet it is argued that in ordinary sewers it could never give the air a velocity greater than half that of the sewage.

Finally, Dr. Soyka devotes a few paragraphs to the question of the forcing of traps from the sewer side, and shows theoretically that in a ventilated sewer no conditions could occur which would seriously affect a seal of even two inches only.

In summing up the most important relations which govern the circulation of the air in sewers based on the Munich experiments, Dr. Soyka states the conclusions about as follows:

It must first of all be asserted that under ordinary conditions a system of sewers such as the one examined can show no constancy nor uniformity in the circulation of the air, either in the sewers themselves, nor in the connections with houses and streets, in the junctions and outfalls. This is shown clearly when comparing the circulation at different seasons, at different conditions of the atmosphere, and even at different hours of the same day. It happens even that in one sewer at the same time the currents of air can be in different directions, owing to the large number of openings for ventilation into the street, the untrapped house drains and other conditions, which cause local currents independent of those in neighboring sections.

Among the factors which cause a movement of air, a difference in its temperature must take a leading place. The atmosphere and sewer air will differ more or less in this respect nearly all the time. In summer the atmosphere is warmer, in winter it is colder.

Therefore the sewer air should show sometimes an upward, sometimes a downward motion. In winter the lighter sewer air should rise to the higher end, in summer it should flow to the lower one.

But this tendency is counteracted by a number of powerful influences, so that the actual observed motion is often contrary to what theoretically on the above grounds might be expected.

Differences of temperatures at certain points may themselves be a cause. Where the house drains are not trapped and are carried beyond the roof, the temperature of the house affecting the soil pipe will impel the air to be drawn in or expelled at the sewer connection, as the case may be, and influence the movement of the air in the common sewer. In fact, when many house drains in a sewer act in the same way, the combined force may even reverse the current otherwise found in the sewer. Such factors must be considered, when it is intended by means of special ventilating arrangements, such as stacks, to prescribe a certain course to the air, otherwise results varying from those expected will occur.

The assertion that sewer air should have an upward tendency because of its being lighter on account of the greater degree of humidity, is not sustained. This result could only happen when the temperatures of both sewer and outer air are about the same, which rarely occurs. The changes of weight caused by the changes of temperature are much greater than those caused by the degree of humidity. It is therefore of little influence and is moreover fully nullified by the physical and chemical actions of the sewer air.

The sewage itself flowing along the bottom of the sewer with a constant stream of slightly varying quantity, imparts its motion to the air above it, and thus sometimes acts with, at other times against, the effects of temperature. The relative importance of this influence depends on the relative quantities of air and of exposed surface of the sewage. In large sewers the motive power of the sewage is usually less than that of the differences of temperature; in small ones it is often greater.

Dr. Soyka concludes with the remarks that, if the observations made in Munich can be applied to other localities, then it is not possible, in view of the constant changes in the circulation of sewer air, caused by natural conditions of climate and the usual and proper design of the sewers, that this air and the gases it carries should be the special cause of epidemics spreading into certain definite localities and definite directions.

Regarding the latter, we might say that while this conclusion is arrived at mainly through a controversy still active in Germany and France, as to whether fæcal matter should be discharged into sewers or carried away in pails or other separate manner, it is no less valuable to those countries which advocate water carriage without question. But we should like to emphasize the provision made by Dr. Soyka, as to his conclusion being valid only when the sewers are properly designed. The want of the necessary skill in this direction might still, as has been shown in England, contribute towards the propagation of epidemics in certain otherwise protected localities.

THE STEAM PIPES IN NEW YORK STREETS.

NEW YORK, N. Y., *Dec.* 19, 1882,

To the Editor of THE SANITARY ENGINEER :

To your strictures on inspectors and contractors in your editorial on "The Streets of New York," which appeared in your paper of December 7, you should have added that for work outside the curbstone no contract should be made for doing any part; one of the companies, if I am properly informed, did sub-let some work—digging and filling.

Your suggestion for concert of action is a good one, but it is almost too much to expect that rival systems and rival companies will willingly assist such an arrangement, and without their coöperation, at least during their chrysalis state, is it possible to establish a *modus operandi* by which such a regulation could be carried out?

An objection which I heard made to your suggestion of a sub-way was its magnitude, and that in many places it could not be drained, and would necessitate a special system of sewerage. To this might be answered that the space under sidewalks, which properly belongs to the streets, should be given up in the narrow down town streets and elsewhere, if required, upon a just and equitable settlement, and that the city should arch and build the sub-ways and keep them in repair, as they do sewers and pavements, and give *allotted* space within them for public improvements (not including explosive compounds, which are safer buried in the earth.)

But, sir, the sub-way is a thing of the future, and the repeated tearing up of the street is of to-day. *Why is it that there is a necessity to remodel some of the work, and is this remodelling to go on all winter under the name of repairs, and will the alteration improve matters?*

As you may be aware, there is a great difference in matters of detail between the two steam companies, an approximate sketch of each of which systems I submit—Fig. *A* being the American and Fig. *B* the New York. In general, both send out steam through wrought iron mains, and the New York is receiving back a large quantity of its condensed water (all that is not used in the engines) through a parallel main, and the American company have parallel mains through which they intend to receive back what water they can when they are in working order.

System *A* has three pipes, two (1 and 2) being the conveying pipes, and one (3) the return pipe, but in many places the conveying pipes are supplemented by distributing pipes, which start from the flanges (*f*) at the junction and run parallel with the other pipes, while in other places the conveying pipe does duty for both purposes. Pipes 1 and 2 are connected with the eight-branch cross (junction) with a stop valve *c*, and an expansion joint *d*, the expansion joints; though it may be with the expansion joints of the steam pipes as well. When expansion takes place, the thrust of the long pipe, caused by expansion when heated, is against the lower elbow, and the resistance from the pressure within the pipe is against the upper elbow, the thrust not being in a right line, but angular, causing the brass of the slip joint to bind on the sides of the sleeve. The sketch *C* will give an idea of this, in a better manner than words can. The thrust of the pipe is in the direction of the arrow *a'*, and the resistance from the pressure and from the friction of the gland is in the direction of the arrow *b'*, which causes the offset to assume the position shown; binding the brass at *c* and *c'*, in such a manner that it is almost impossible to move it, the result being the fracturing of pipes or elbows. The dotted lines *e'* shows the bent pipes (offsets) which are being substitated in places for the elbows and piece *d'*.

Fig. A.

Fig. B.

Fig. C.

The duplicate system used by the American Company presents features not covered by the New York Company's method, and might be used as an argument of their inventions *not to do things cheaply*, but it is questionable if what can be gained in the way of preventing interruptions will warrant the expense and complication where the street blocks are as short as in the lower districts.

Yours, very respectfully, T.

[Our correspondent is a man who has extended experience in the matters he discusses, and his suggestions are entitled to consideration.—ED. SAN. ENG.]

Food and Drugs.

FOOD AND DRUG PRESCRIPTIONS.

To the Editor of THE SANITARY ENGINEER :

In your issue of Dec. 14, 1882, are two articles referring to prosecutions under the new food and drug law in this State. It is very properly urged that the analysts of the State Board of Health should fix and publish standards of strength and purity for articles of food or medicine.

But I would suggest further, that it is due to all parties concerned that the analysts appointed to make these investigations and to prescribe standards, should also give in detail the methods of analysis whereby they work. They should state that a certain article tested in a certain manner should be proven to contain a certain amount of the substance sought. The new U. S. Pharmacopœia illustrates this method of making definite requirements of purity or percentage based upon definite methods of assay: good illustrations are the assay methods for opium, cinchona barks, alkaloids, and salts, sweet spirits of nitre, the acids, salts, etc.

Unless some such method of basing requirements upon definite methods of assay is adopted for the more important foods and drugs, we shall soon find every public and private analyst a law unto himself, and the reports of our prosecutions will be as farcical as much that has been recorded in England. Very many of the disagreements between English analysts have arisen from the use of methods radically different, and, frequently, radically incorrect.

Although there has been in that country an analytical court of final appeal, which seems to have been administered in a conservative and able manner, there has been no corporate body with the right and power to prescribe methods of analysis as well as standards of strength and purity.

The writer has had some experience in the analysis of commercial foods and drugs, and is every day more and more impressed with the fact that many accepted methods of analysis are open to criticism, and, where interpreted too literally, are liable to lead to false conclusions. For instance, the literature of pharmacy abounds with schemes for the assay of opium and cinchona barks; but any competent analyst knows from experience that only about one article out of every hundred contains really valuable information. In like manner we see articles in the various secular and scientific journals to the effect that Prof. So-and-So has examined a large number of samples of this or that, and has found all to be adulterated. Upon closer investigation the fact is developed that the method of analysis, upon which these statements were based, was faulty. Instance the assay of laudanum by simple evaporation, and the assay of quinine pills by use of the microscope alone!

It is not my belief that any of the analysts of our State Board of Health would make such palpable mistakes; in

* The expansion joint used is not a slip joint; its principle is a flexible diaphragm.

Digitized by Google

fact, there is every reason to believe that they are well qualified not only to prescribe limits but also to prescribe methods of assay. But there is naturally more or less uneasiness as well as uncertainty among conscientious manufacturers lest they be judged by wrong standards or wrong methods of assay. Every careful manufacturer has his own methods for testing the preparations which he makes or buys. It is probable that these methods may not always be the most refined and accurate, yet they are the ones by which the trade has been guided, and to suddenly proclaim standards of strength without also prescribing methods of assay would cause more or less confusion.

But aside from this, the party accused is entitled to know the grounds upon which the accusation is based. Naturally the facts will be elicited during an important trial where considerable is at stake, but in petty cases a party morally innocent, yet declared technically guilty upon the evidence of the analyst, may prefer paying his fine to contesting the matter.

An early publication of standards and methods of valuation will be of great interest, and will doubtless prevent many unwitting infractions of the law as interpreted by the analysts.

In conclusion, the gentlemen who are charged with these important duties can do much to improve the application of scientific methods to the examination of foods and drugs, and can accomplish a great deal in the direction of furnishing the public with purer goods. They can depend upon cordial support from all fair-minded manufacturers and citizens.

Very respectfully yours,

HENRY B. PARSONS.

NEW YORK, *Dec.* 16, 1882.

RETAIL AND WHOLESALE GROCERS AND THE PROSECUTIONS.

The *German American Grocer*, which is the official organ of the New York Retail Grocers' Union, says, "The grocers do not want to fight the law; on the contrary they want to sell pure unadulterated goods, not only because their profits will not diminish by so doing, but also, and mainly, as a principle of honest dealing."

It is, however, inclined to find fault because the first prosecutions were brought against retail dealers. A moment's reflection should make it apparent that the Inspectors of the Board of Health must buy their samples in small quantities and as usually sold at retail stores. So long as the retail grocer sells adulterated articles he is liable to prosecution, and because some one else does the same is no excuse for him. It does seem a little hard that the grocer who supposes the goods he sells to be pure, should be prosecuted before the manufacturer who fraudulently adulterates the goods. At the same time such a course seems quite unavoidable. A single manufacturer may sell to fifty retail grocers, and the chances of finding adulated goods are very greatly increased by buying of the latter class. Then again it is, as a rule, difficult to get small quantities from the wholesale dealers or manufacturers. It involves a useless expenditure to buy five or ten pounds of an article for analysis, while a few ounces are amply sufficient. An Inspector who applied to a manufacturer for a quarter of a pound of cream of tartar would naturally be regarded with suspicion, and if he was served at all, it would doubtless be with a genuine article, whereas there might be hundreds of pounds of the article adulterated in the place.

The grocers who have been prosecuted will have an opportunity at the trial to state their case, and we sincerely hope that the wholesale dealers, who are really the parties at fault, will be thoroughly advertised and prosecuted by the "Union." There are plenty of wholesale dealers who represent their goods for just what they are, and we shall be surprised if the dishonest ones under the pressure thus brought to bear upon them do not find it to their advantage to mend their ways.

The action of the State Board of Health must not be considered as in any way a persecution of the retail grocers.

The evil exists, and the Board has taken what seems to it the best means for checking it.

The *American Grocer*, the leading grocery paper in this country, in commenting on the recent arrests for violation of the food adulteration law of this State, gives the following very sound advice to the retail grocers. If they are wise they will follow it and spend their money in suing those who have fraudulently sold them debased goods instead of wasting it in attempts to resist the operation of the law.

"Fully one year and a half has elapsed since the act was passed and there is no excuse for any retail grocer being ignorant of its provisions. Not only has it been noticed in the daily press, but it has been published in detail by trade papers, and its provisions made known by individual effort.

"We have no doubt that in many cases grocers are unaware of the extent to which certain articles of food offered for sale are debased by adulteration. And yet for a grocer to confess, in these days of cheap news and active competition, that he is not posted as to the quality of the goods he handles, is to convict himself of an ignorance that is little short of criminal.

"We hope the warfare against the sellers of the infamous compounds sold as cream of tartar will be vigorously carried on amongst the apothecaries. Would it not have been better to have commenced with the manufacturers of impure articles of food, rather than with the retailers? It may be that the manufacturers are not as accessible to the officers of the State as the retailers. It would be well, however, for retailers to remember that they have an unquestioned right, where they buy goods sold to them as pure, but in reality adulterated, to sue the seller, whether manufacturer or wholesale dealer, for damages.

"Every true merchant is interested in seeing the Adulteration Act enforced with vigor. It will serve to stop in this State the sale of adulterated goods manufactured out of the State. It will compel manufacturers and jobbers to keep goods that comply with the provisions of the act, otherwise they become parties to the annoyance and arrest of the retailers. There is just one lesson to be learned from this first arrest. Buy the best goods from reliable houses and take pride in keeping only the best articles. Educate consumers up to a high standard by circulating information in regard to debased food. In short, obey the new law, not only because it is a statute, but from self-interest."

Gas and Electricity.

Illuminating Power of Gas in New York City.

E. G. LOVE, Ph.D., *Gas Examiner.*

NEW PROCESSES OF GAS MANUFACTURE.

The advent of another gas company in this city, recently referred to in these columns, has suggested that a description and discussion of the process by which it is proposed to make gas of a better quality and at less cost than by existing methods, would be interesting to our readers. The following has therefore been prepared with that object in view.

The Equitable Company, whose President is Mr. Edward Stern, holds three patents issued to C. M. Tessié du Motay in 1880. These patents are similar in most particulars, and relate to a process for producing hydrogen gas. It is proposed to decompose, by means of highly heated caustic lime, a mixture of steam and naphtha vapor, or other gaseous substance containing carbon. The mixture of steam and naphtha vapor is first passed through a superheater, after which it enters the converting furnace. This, as shown in the accompanying illustration, consists of an inverted V-shaped chamber which is filled with caustic lime through the opening at the top. The patent states that "the furnace is made in two parts, with the object of having one portion cooler than the other."

The contents of this chamber must be heated to a high temperature by gas from a separate generator. This done, the mixture of steam and naphtha vapor is allowed to enter at one end, which is supposed to be the hotter part, and passing through the lime in the first arm of the chamber is decomposed with the formation of hydrogen and carbonic acid. "This carbonic acid is subsequently taken up by the lime in the cooler portion of the double furnace, the lime in the first portion being too hot to enter into combination with carbonic acid and form carbonate of lime."

When the temperature of the lime becomes so low that the decomposition is not effected, the flow of steam and naphtha is diverted into another similar furnace, the carbonate of lime in the chamber is rendered caustic again by contact with combustible gases from the separate generator. In this way the process is intended to be continuous—the same line acting over and over again without removal from the chamber. Indeed, the patent states as the most important improvement of the process, the reconversion of the carbonate of lime into lime. It is also claimed that "heated brick or other similar substance" will not take the place of the lime in the decomposition of the gaseous mixture. With lime the resulting products are hydrogen and carbonic acid, while with other material hydrogen and carbonic oxide would be produced.

It hardly seems probable that any intelligent engineer would undertake to manufacture gas in this way, with the slightest idea of making it a commercial success. If experience teaches anything, it certainly is not saying too much to assert that a commercial gas cannot be made by the process as described in the patents. In the first place in heating the lime in the chambers is it possible to heat one branch to a temperature which will effect the decomposition of steam without at the same time heating the other branch to a very high temperature—a temperature at least which would not permit the absorption of carbonic acid to any extent? Moreover, it appears clear that even though the lime in one part of the chamber was cooler at the start, it would soon be raised to a very high temperature by the gases which come from the other part, and which are heated to a point necessary for the decomposition of steam. We are asked to believe that lime will take up carbonic acid at a temperature at about which the carbonate of lime would itself be decomposed. Besides all this, we have the oft-repeated chemical fact that lime will not absorb carbonic acid unless it is in the hydrated form. It is useless to claim that the lime in the chamber in question would be hydrated even though an excess of steam were mixed with the hydrocarbon vapor. We are at a loss to understand why any refractory material would not answer as well as lime in the chamber. No chemical change takes place in the lime, nor does it aid

in the decomposition of the steam in any way except to offer greater heated surface. The assertion that carbonic acid is produced in one case and carbonic oxide in the other simply means that in the latter the oxygen is deficient. Introduce a little air or an excess of steam and carbonic acid will result.

Of the three patents mentioned, the first involves the use of steam and naphtha; the second, steam and water gas; and the third, steam and coal gas. The object of the naphtha is to furnish carbon with which the oxygen can unite, thus liberating hydrogen, which is claimed to be the principal constituent in the commercial gas. Is naphtha the cheapest form in which the necessary carbon can be furnished?

In the second patent "water gas" is substituted for the naphtha. Why not introduce an excess of steam in making the "water gas" and produce carbonic acid at once? For the simple reason that it would take a large part of the profits of the manufacture to remove the carbonic acid. If "water gas," enriched with naphtha, cannot be sold for less than $2.25 per thousand feet, does it seem probable that the crude gas can be reduced fully one-third in volume by the removal of the carbonic oxide—to say nothing of the expense attending such a course—afterwards enriched with naphtha to acquire illuminants, and then be sold at a lower price than the original water gas.

The proposition to employ a mixture of coal gas and steam is even worse than those already noticed.

The only document of any value which we have seen, of those sent out by the Equitable Company in support of their claims, is a report of some experiments made by Mr. W. H. Bradley at the Municipal Gas Works, and this

Digitized by Google

report shows most conclusively the impracticability of the scheme.

Mr. Bradley made some experiments with the inverted V-shaped chamber already mentioned, and found "that the steam and hydrocarbon vapor did not come in contact with the heated lime sufficiently to effect its decomposition." After two months' trial the apparatus was abandoned and a new apparatus devised. This consisted of two vertical chambers of iron lined with fire brick, which were filled with caustic lime, and manipulated in the manner already described. While it was possible to decompose the steam in contact with naphtha vapor, and by an excess of steam, get a mixture of hydrogen and carbonic acid, with a little carbonic oxide, it was found impossible to remove the carbonic acid by the heated lime, and purification by the ordinary methods were rendered necessary. It would be possible to purify the mixed gases by hydrated lime, but the temperature of the gases would have to be greatly reduced, and as the report says the cost of such purification "would be something enormous," and quite fatal to the process.

This is in substance the process by which the Equitable Company proposes to furnish cheap gas to consumers. Even from this general consideration of the subject there appears to be no reasonable grounds for supposing that in its present form it will prove anything but a failure.

Meter-ites.

The new National Petroleum Exchange, of New York, was opened December 18.

The electric lamps which have been used for a year at the York railway station have been replaced by Bray's gas burners, on account of the greater cost of the electric light.

The Special Committee of the Gas Institute received contributions of upwards of $30 000 in one week recently, for their expenses in connection with the International Electric and Gas Exhibition at the Crystal Palace.

Some of the strongest objections to the smoke nuisance in Chicago have been directed against the public schools, until the Board of Education have at last ordered smoke consumers of several makers to be applied to the boilers of the schools which have been most complained of.

Still another gas company is in the field in this city. The Excelsior Gas Light Company has asked permission to lay mains in the streets, and promises to charge small consumers $1.50 to $1.75 per 1,000 cubic feet, and large consumers $1.00. Time will tell.

The *Gas Engineer* says that the experiments going on at Gartsherrie in obtaining tar and ammonia from the blast furnaces, are showing good results, and other iron masters are adopting the process. The cost of apparatus is £5,000 per furnace; the annual profit is estimated at double that sum.

The Siemens' regenerative gas lamp is being introduced into the large manufactories and ship-yards on the Clyde. A firm of ship-builders at Dumbarton has two 600 candle power lamps; a Point house ship-yard has four of 330 candle power, and several others are in use in other establishments. A lamp of 800 candle-power is to be set up in St. Vincent's Place, Glasgow.

ELECTIC LIGHT NOTES.

The Western Underground Electric Company broke ground in Chicago last week for laying pipes for underground telegraph wires.

Edison lamps are used in lighting the Society of Arts rooms, in London. A Siemens' dynamo, driven by an eight horse power Crossley gas engine, furnishes the current. Fifty of the lamps are at present in use.

Two hundred and fifty Edison lamps are now used in the editorial rooms of the Boston *Herald*. These lamps are also used in the Bijou Theatre in that city. There are 192 of them under a tin reflector just inside the proscenium arch; 140 under a similar reflector over the stage, 90 on the central chandelier of the auditorium, and 18 in each of two small chandeliers near the sides.

Superintendent Smith, of the Telegraph Bureau of this city, called the attention of the Fire Commissioners, last week, to the destruction of several magnet coils in fire alarm boxes, caused by electric light wires coming in contact with the wires of the Fire Department. Mr. Smith recommends that the offices of the electric lighting companies should be connected by telegraph with fire headquarters, in order that employés of the companies may go to fires and cut wires when they are in the way of the firemen.

The *Engineer* says that at a recent meeting of the Paris Academy of Sciences a paper was read on the "Results of Experiments Made at the Exhibition of Electricity on Incandescent Lamps," by MM. Allard and others. In general and for the spherical mean intensity of 1.20 Carcel, only about 12 to 13 Carcels per horse power of arc, or 10 Carcels per horse power of mechanical work, can be counted on, from incandesent lamps. Electric candles give 40 Carcels per horse power of arc, regulators nearly 100, so that, generally, the economic values of the three systems are nearly as one, three and seven.

AN INVENTOR WANTED.

One of the most important inventions now wanted is perfect ventilation for railway cars. Somebody will yet hit upon the exact thing wanted. It required nearly a half century to perfect an air break which would effectually and by a simple operation stop a railway train. But it was done at last. It required a quarter of a century to invent a sleeping car and to bring it to its present state of perfection. Then came the steel rail with the fish joint, and the improved locomotive, now almost a perfect machine. All these are wonderful improvements. But there has been no great improvement in the ventilation of railway passenger trains, although a hundred devices have been tried. The passenger in crossing the continent, or in traveling a few hundred miles, finds himself covered with dust. He emerges with a face covered with grime, with soiled clothes, and in a state of positive discomfort. If he travels across the continent, he is covered at one time with alkali dust, at another with white or yellow powdered clay. It pervades the cars and takes possession of the passengers. Whoever has noted the effect of driving snow storms in the Atlantic States knows how snow will be sifted into the most weatherly houses. It is driven under doors, under window casements and under the eaves of dwellings. Now dust is driven in the same way. No device has ever yet been applied which will effectually keep dust out and let fresh air in. The first step in the way of perfecting an invention is to make every window immovable. These should never be subjected to the caprice of the passenger. The window should be for the admission of light and nothing else. It should, therefore, be a fixture, fastened into the solid wood and made air-tight. Doors, also, should close without noise, but should be air-tight as to all the margins.

Shutting the dust out in this way means shutting out the air. The next step will be to get the air in entirely free from dust. By some inventions it is filtered through water. Ventilation of some sort can always be secured by the motion of cars against a resisting atmosphere. But how to obtain ventilation when the cars stop has been one of the difficulties. Just then passengers will be gasping for fresh air. Windows and doors having been made air-tight, ingress and egress to cars will present another difficulty. On some trains a hood or elastic cover between the cars is employed, the passenger entering at the side through an opening in the curtain or hood, the orifice closing after him, and then entering the car through a door supposed to close and become air-tight. The air is filtered in at the top of the car and falls down gently upon the pasaenger. But foul air must be pumped out as well Moreover, no ventilation of a passenger car can ever be perfect which is not effected when the car is stationary as well as when in motion. The air brake derives its power from the locomotive. It is reasonably clear that no device for ventilation will be perfect which does not depend upon the same source. The locomotive must supply ventilation just as the "doctor," or small cylinder supplies water to the boiler when the locomotive is stationary. The difficulties of perfect ventilation are further beset by the difficulty of shutting out dust. But at no distant day an inventor will come along with a plan so simple that the wonder will be it had never been hit upon before. Very likely the inventor will be a railroad man—one who knows just what is wanted, and who knows, also, just where all other inventions have come short of complete success.

The other great invention which the coming man will bring is a perfect pavement for heavy traffic. It is the old story in nearly every large city in the country. The best pavements are so expensive that they threaten bankruptcy. The poor ones are an abomination. There is not a well paved city in the United States if estimated by European standards. Wood and brick will be discarded as worthless pavements. Stone and iron are left for further experiments. Two good sidewalk pavements are now laid in this and some other cities, one of asphaltum and the other of concrete or manufactured flag stones. The difficulty is to hit upon a *good* pavement which is cheap, durable and comfortable. At this date nothing more effective has been found than blocks of hard stone laid on a bed of concrete, as such pavements are now laid in European cities. That is the point of departure for the inventor. How can the city roadway be made to meet all the demands of modern traffic together with economy, comfort and conformity to sanitary requirements? It must be remembered that in former times there never was such abrasion and wear of pavements as that now effected by the immense loads which in the interest of commerce, are constantly transported through the principal streets of large cities.—*San Francisco Bulletin.*

ELECTRIC ATTACHMENTS FOR WATER PIPES.

We quote the following from the English *Building News*: How far the application of electricity can be depended on to supplement the reliability of servants is a question. This idea is a clever one, but of its practical utility we are somewhat skeptical.

"A simple method of preventing the bursting of water pipes during frosty weather has recently been patented by Drs. Buxton and Ross, and was exhibited at the late Electrical Exhibition at the Crystal Palace. A valve of special construction is screwed or soldered into the end of the house main service pipe in the cistern, and a piece of string or wire conducted from it to any convenient spot, and fastened to a hook. When frost is expected, the spring is unhooked and the valve falls upon its seat, and air being admitted through the small pipe which rises above the surface of the water, the pipes can be emptied by simply

turning on the tap at the lowest point in the house service, the water in the cistern being saved.

"To obviate forgetfulness on the part of servants, the inventors have called in electricity to their aid. A thermometer of special construction is so arranged that when the temperature falls below 33° a current is sent through an electro-magnet, which releases a catch, causing the valve to fall upon its seat, and at the same time opening a small pet cock at the lowest point in the house service and draining the pipe. The battery is cut out by the fall of the catch, and when the valve is raised again that water may flow into the pipes, the connection is made good. The electrical part of the apparatus is by no means an *essential* feature, but simply saves trouble, and prevents the possibility of allowing the pipes to remain full during frost, as the contrivance is automatic by its agency."

SUBURBAN SCHOOL HOUSES.

Mr. Warren R. Briggs, an architect of Bridgeport, Conn., who has given much attention to the construction of schools on sanitary principles, has prepared for the State Board of Health of New Hampshire a paper on suburban school houses, a copy of which we have received and have read with interest.

It contains a plan which is in many respects quite original, as will be seen by examining the figures which we reproduce. His proposed school room is for forty-eight pupils, and contains 1,152 square feet of floor space,

Digitized by Google

or 23.5 square feet to each person. The windows are all in the rear of the pupils; and the building is to be so placed with reference to the points of the compass that from the windows on the left is obtained a steady north light, and from those on the right the morning sunlight. The height of the school room is 14 feet in the clear, giving an allowance of 347 cubic feet per person. The window sills are four feet from the floor, and the openings run up to within two feet of the ceiling, giving to each person 411¾ square inches of glass surface. The whole space under the school room is to be used as a play room.

It will be seen that he places the water closets in the building on the same floor with and close to the class room. This is contrary to the usual recommendation, but is no doubt preferable to the yard privy as usually arranged, and his location of them is certainly much better than placing them in the basement. He advises the use of simple porcelain hoppers, with tanks overhead, the flow to be produced by mechanism connected with the seat. His plan for the heating and ventilation is essentially that used in the Bridgeport school house, described in THE SANITARY ENGINEER, vol. V., page 4. He allows 30 cubic feet of fresh air per person per minute. We doubt very much the truth of his statement that "the outgoing flues should be at least twice as large as the incoming, no matter how large the latter may be," and predict that if this rule be followed there will either be danger of down draughts or an undue amount of driving power for the exit flue must be provided. His allowance of steam heating surface is 900 square feet for the room, being about one foot of heating surface to every 17½ cubic feet of space to be warmed. This is a large allowance, but not too much under the circumstances. The whole paper shows careful study, and we recommend its careful perusal by all who are interested in this subject.

AN EXPLANATION.

HEALTH DEPT., D. C., *Dec.* 23, 1882.

To the Editor of THE SANITARY ENGINEER:

Referring to the strictures of Mr. Gerhard anent the report of Mr. Robinson, our Inspector of Plumbing, I would say that Mr. Robinson has given the credit due Mr. Gerhard in his report to the Health Officer. The portion giving this credit was probably omitted by inadvertence in the making of copy for your journal. I am satisfied that Mr. Robinson was not knowingly guilty of plagiarism, and I write these few hurried lines to assure you of that fact.

Very truly yours, J. C. MCGINN.
Chief Clerk, Health Dept.

GAS MACHINES.

STAUNTON, VA., *Dec.* 6, 1882.

To the Editor of THE SANITARY ENGINEER:

Will you please answer the following, as it may be of benefit to others:

In this city there is a Springfield Gas Machine rated for 150 burners. There are about 125 burners on it. The generator is about 75 feet from the blower and about 20 feet elevation; temperature at generator about 50° F. in coldest weather: temperature at blower about 65° F. The air pipe runs to outside of house. The main gas pipe is two inches and runs in the ground for 75 feet; then passes through two boiler rooms that are kept heated to about 150°; then passes through a cold room and again in a heated room. There is a party now changing the air pipe from outside of house to this boiler room. I claim this should not be done, for two reasons; first, if there should be a back pressure of gas through this air pipe it would discharge gas in the room and cause a fire; and second, the hot air will have to enter a cold pipe from the blower to the machine and will become as cold as the air outside before it reaches the generator. I told the parties the main gas pipes ought to be changed, so as to be as cool as the generator, and they should not pass through any hot room. I will state that in the summer time this same machine supplies double the quantity of burners, but in the summer there are no heated rooms for the gas to pass through.

By giving me your valuable opinion on the above you will greatly oblige, Yours respectfully,
C. BARGAMIN.

[The air supply should not be taken from the boiler room, but preferably from the outside air. The higher the temperature of the air supply, within existing conditions, the greater will be the amount of hydrocarbon vapor absorbed. If the air which enters the generator has a high temperature it may absorb more vapor than it can retain if subsequently the temperature is greatly reduced. Aside from this we do not think the change of temperature will have any practical effect.]

MOISTURE AND TEMPERATURE.

To the Editor of THE SANITARY ENGINEER:

What will be the effect of running a heating apparatus as regards the effect of the heat with and without evaporation?—in other words, would a room heated to say 60° Fah., dry air, feel warmer to the occupants at same temperature, providing ample moisture was provided from evaporators? I do not know if I have made my meaning plain, but my idea arises from the fact of having noticed, in summer time that on a moist day, or what is called "muggy" weather, the heat is felt more than it is on a dry day with a higher temperature as shown on the thermometer.

J. W. H.

[The presence of moisture in the air has a strong influence on bodily sensations as regards temperature. In an atmosphere nearly saturated with moisture, as in the west and south of England, Ireland or Normandy, 60° F. is sensibly as warm as 75° F. would be in Canada or Minnesota where the air is comparatively dry.

Digitized by Google

Were it possible, therefore, to maintain in a room artificially warmed to 60° F. a nearly saturated condition of the air as regards moisture, such a room would be as comfortable as one heated to 70° F., and being nearly free from moisture. But with the external air at the freezing point in this country it is practically impossible to supply the vapor required to maintain such moisture; and it would take more fuel to vaporize the water than it would to heat the room. The only way to effect it would be to have a room absolutely air tight and without ventilation. It would require 5.46 grains of water to each cubic foot of air; 4.02 grains of this must be evaporated by heat, requiring 0.612 units of heat, while the amount of heat required to heat a cubic foot of air from 32° to 68° is 0.635 units or very little more than that required to effect the evaporation.]

REVERSED BLUE PROCESS OF COPYING DRAWINGS.

WORCESTER, MASS., *Dec.* 16, 1882.

To the Editor of THE SANITARY ENGINEER:

I recently bought a "Reversed Blue Process Paper" for copying tracings. I have followed the printed directions, but cannot get good results. The difficulty is in producing a white background. I get it almost clear (except of a light blue tint) in the acid bath; if I brush the paper it fixes in the blue tint. If I let it remain for any length of time it has the same effect. What I wish to know is how can I secure copies of tracings in blue on perfectly white background? An early answer would much oblige,

Yours truly, J. B. W.

[The importer and dealer in prepared paper used in this process guarantees a perfectly white background, if directions are followed; but a gentleman who has been experimenting carefully with it informs us that he has experienced the same trouble you complain of, and has never secured good results with large drawings. A chemist connected with THE SANITARY ENGINEER will experiment with the process and report results.]

THE BOSTON PLUMBING ORDINANCE.

At their meeting, December 21, the Boston Board of Aldermen passed the ordinance regarding plumbing which is printed below. In submitting the report of the Joint Standing Committee recommending its passage, Alderman Pratt explained the attitude of the plumbers of Boston to the ordinance in terms which do great credit to the trade there. He said: "As the preparation of regulations for plumbing requires a knowledge of the technicalities of the art, your committee deemed it advisable to consult with persons of practical experience, and accordingly invited a number of the master plumbers of the city to confer with them on the subject. The committee were gratified at learning that plumbers cordially endorsed the proposition, and were willing to lend their aid in the matter. At the request of your committee a meeting of master plumbers was called, and a committee of their own number appointed to prepare regulations to be submitted to your committee. This was done, and the accompanying ordinance embraces the regulations agreed to by the committee on plumbers. Perhaps the strongest argument in favor of adopting this ordinance is the fact that plumbers are so keenly sensible of the evils that arise from bad workmanship as to voluntarily assist in imposing restrictions upon themselves."

The text of the ordinance is as follows:

Be it ordained by the City Council of the City of Boston, as follows:

SECTION 1. No person shall carry on the business of plumbing who shall not have first registered his name and address in the office of the Inspector of Buildings; and notice of any change in the address of a registered plumber shall be immediately given to said inspector.

SEC. 2. Every plumber shall, before constructing new work or extending or altering old work (except repairing leaks) file at the office of the Inspector of Buildings, upon blanks to be provided for the purpose, a notice of the work to be performed; and no such work shall be done in any building without the approval of said inspector.

SEC. 3. Every house or building shall be separately and independently connected with the public sewer, when such sewer is provided.

SEC. 4. All house drains and soil pipes shall be of iron and shall be securely ironed to walls: provided, however, in cases where it is impracticable to run said pipes on walls, they may be laid in trenches of uniform grade, or suspended to floor timbers by strong iron hangers. All changes in direction must be made with curved pipes and all connections with horizontal pipes, to be made with branches. House drains shall be run at least three feet outside of house walls. At the end of the house drain a running trap shall be placed, with an accessible cleanout on each side. Every house drain shall be provided with a four-inch fresh air inlet on the house side of the trap, with a four-inch pipe extending therefrom to the external air and terminating at a point not less than three feet above the ground, as the Inspector of Buildings may direct. All soil pipes shall be carried out through the roof, undiminished in size, to such height as may be directed by the Inspector of Buildings, provided, however, that no soil pipe shall extend a less distance than two feet above the roof of any building.

SEC. 5. When rain water leaders connect with soil or drain pipes, deep traps shall be placed on said leaders; and in no case shall such leaders be connected outside of the main trap.

SEC. 6. No brick, sheet metal, or earthenware flue shall be used for a sewer, soil or waste pipe ventilator, nor shall any chimney flue be used for such purposes.

SEC. 7. All iron pipes shall be coated inside and out with coal tar pitch, applied hot, or some equivalent substance. All joints shall be run with molten lead and thoroughly caulked and made tight, and no paint nor putty shall be used on said joints. All connection of lead with iron shall be made with brass ferrules, properly soldered and caulked to the iron.

SEC. 8. Every sink, basin, bath-tub, water closet, and each set of trays, together with every fixture having a waste pipe, shall be furnished with a trap which shall be placed as near as practicable to the fixture that it serves. Every trap shall be protected from syphonage or air pressure by a special air pipe of not less than one and one-half inch bore. The air pipe for water closet traps shall be not less than two-inch bore for not more than thirty feet; for more than thirty feet it shall be not less than three-inch bore. All such air pipes shall be not less than four-inch bore where the same pass through the roof. When practicable two or more air pipes may be connected together or with a soil pipe, but in every case such connections shall be above the top fixture; and all air pipes shall be run as direct as practicable.

SEC. 9. All drip or overflow pipes from safes under water closets and other fixtures, or from tanks or cisterns, shall be run to some conspicuous point, and in no case shall any such pipe be connected with a drain, waste pipe or soil pipe.

SEC. 10. No waste pipe from a refrigerator or other receptacle in which provisions are stored shall be connected with a drain, soil pipe or other waste pipe, unless it is provided with a trap, suitably ventilated, and in every case there shall be an open tray between the trap and refrigerator.

SEC. 11. Every water closet, or one line of water closets on the same floor, shall be supplied with water from a special tank or cistern.

SEC 12. No pipes or other fixtures shall be covered or concealed from view in any way until after the work has been examined by the Inspector of Buildings; and said inspector shall be notified by the plumber when the work is sufficiently advanced for inspection.

SEC. 13. All work in new buildings shall be tested by the Inspector of Buildings with the peppermint test, and in case the work does not stand the test, the water shall be turned off from the building and not let on until the plumbing has been pronounced satisfactory by the Inspector of Buildings.

SEC. 14. Whoever violates any provision of this ordinance shall be liable to a penalty of not less than twenty dollars nor more than fifty dollars for each offence.

Reviews of Books.

BOSTON, MASS., SIXTH ANNUAL REPORT OF THE WATER BOARD FOR THE YEAR ENDING APRIL 30, 1882.

This report of 178 pages is full of interesting matter, which would be much more available for reference if there was an index. As it is, any item of information can only be found by turning over page after page.

The Boston Water Works are under the charge of a board of three Commissioners, with the City Engineer as the chief executive officer.

The report of the Board itself is brief and clear. It is a model in its way, setting forth in few words, but explicitly, the condition of the large works under the control of the board, and their recommendations as to the future. The immediate undertaking of the enlargement of the works of supply is urged with force. The Board say: "The steady increase in the consumption of water presents one of the most serious problems which those in charge of the management of water works have to meet."

* * "It has been the practice in the past to provide the funds for increasing the capacity of the works, only when the emergency was most strongly felt by the actual necessities and demands of the consumers. In the opinion of the Board this policy results in great wrong to the consumer. As a general rule the construction of important additions to a water supply includes the loss of several working seasons. This is seldom taken into account, and in consequence, if the works happen to be storage reservoirs, their water has to be hurried into the city, to prevent an actual scarcity of supply, long before it is in a fit condition to be used."

A new storage basin is in course of construction on the Sudbury river, and authority is asked to begin another one. In the meantime, the extravagant use of water must be checked, in order to make the present supply hold out. The Board favor the more extended use of meters, but say, what every sensible person knows to be true, that "there are difficulties in the way of an entire application of the meter system at once, to a city like Boston." In the report of Mr. Wightman, the City Engineer, also, a more extended use of meters is advised in connection with a thorough house to house inspection, and the use of Deacon meters on the mains to ascertain the effect of the inspection in different sections. An interesting report of an application of the Deacon system in Charleston is given by Mr. Dexter Brackett, Assistant Engineer. In this district of 21,760 inhabitants, the daily use of water was reduced from 1,273,000 gallons to 820,000 gallons by the use of the Deacon system of inspection. This result was obtained at an expenditure of $1,511 for meters, and $1,323 for inspection for six and a half months. The cost of the meters being the same for a long time as for a short one, it may be said that an expenditure of about $3,000, per annum effected a daily saving of 450,000 gallons. As this water has to be pumped up to a height of 150 feet and the cost of pumping is $9.66 per each million of gallons delivered into the reservoir, the cost of pumping the amount of water saved, is $1,742 per year, so that in this particular case, it looks at first sight as if it might be cheaper to let the water waste than to stop the waste.

Regarding the application of this system to the city of Boston proper, Mr. Wightman says: "Nearly all the stop-cocks on the service pipes are located on the street roadways, and are inaccessible except by the removal of a portion of the roadway to a depth of a foot or more from the surface. The cost of changing these stop-cocks from the roadways to the sidewalks would cost a large sum, as there are about 40,000 stop-cocks that would have to be changed at an estimated cost of eight dollars each."

This is the great objection to any attempt to check waste in Boston or New York by the Deacon, the Bell, or the Church method of external night inspection, which required the existence of a stop-cock at the sidewalk.

The plan which Mr. Wightman suggests of day house inspection, and checking the result in every section by a Deacon meter on the main, seems practicable and worthy of trial, provided the distribution pipes can be properly districted.

The tables of pipes, meters, metered water, hydrants, taps, etc., are full and satisfactory, except that the superintendent of the Mystic Department does not give the total number of services or taps in use, only noting the additions and changes during the past year.

HOUSE DRAINAGE AND SANITARY PLUMBING.

Mr. William Paul Gerhard's report on the above subject to the State Board of Health of Rhode Island has now been reprinted, with additions in convenient form, by D. Van Nostrand. It is excellently adapted to give the general public an idea of what the details of a good system of plumbing are.

Martin's *Chemists' and Druggists' Bulletin* will hereafter be issued weekly. Its editing is in very competent hands, and it will be of use to the class it aims to serve.

CAUSE OF THE HIGH DEATH-RATE.—"One of the curiosities to be seen at the London Dead-Letter Office is the following, written by a physician: 'This is to certify that I attended Mrs.——in her last illness, and that she died in consequence thereof.—*Ex.*'" We were once shown a death-certificate in the Philadelphia Health-office, in which the physician had evidently filled up the printed blank in a dark room, and had signed his name opposite the "Cause of Death," instead of on the line below.—*Hahnemannian Monthly.*

At the meeting of manufacturers and dealers in proprietary medicines at Rochester, week before last, it was voted to appoint a committee of five to employ legal counsel to prosecute violators of the proprietary rights of members of the association.

A new Eastern District Dispensary and Hospital, Brooklyn, was opened December 18. Mayor Low and others made addresses.

FIGURE 2.—ELEVATION OF CAR, SHOWING HEATING RESERVOIR TO BE CHARGED FROM THE DEPOT GENERATOR.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

THE GRAYDON SYSTEM OF HEATING RAILWAY CARS.

Our readers will remember that we have already (Vol. V., pp. 179, 239) described the methods employed on the elevated railroads in this city for heating passenger cars. A system quite different in its details, the invention of Lt. J. W. Graydon, U. S. N., has been tested successfully on the Troy and Boston Railroad, in which the source of heat is either the locomotive or independent steam boilers at the stations.

Fig. 1, illustrating the former, represents an elevation of a locomotive, tender and baggage car, and also a top plan of the same. It is intended to use exhaust steam from the cylinder or from the safety valve, *A* representing the position of the steam pipe in the first case, and *B* in the latter. Our illustration shows a reservoir *C* in the baggage car; smaller reservoirs are placed in each passenger car so that they may remain heated when detached from the train. The reservoir *C* may also be, as shown, a steam boiler, with furnace, complete in itself, in which case the train is heated from the baggage car and not from the locomotive; but the details are, in other respects, the same. While being charged, the reservoir is shut off from the steam pipes by stop valves. When these valves are opened, the pressure in the reservoir decreases, a greater portion of the hot water becomes steam at a lower temperature, which circulates around the train, and this process goes on until the temperature of the hot water is reduced to the boiling point. The steam pipes connecting with the reservoir pass completely around each car, having radiators under the seats, and are provided at each end of the car with stop valves and couplings for connecting with the steam pipes of the next car. They have a suitable incline from the centre to the ends of the car, where "water receivers" collect and discharge the condensation, without interfering with the circulation, stop cocks being placed between the steam pipes and the receivers, and between the receivers and the outer air.

When the train is coupled the stop valves at the ends of each car are closed, except in the rear car, so that connection between the pipes on each side of the cars is interrupted, except through the rear pipe. At the same time the valves on the couplings between the cars are opened, and there results a circulation from the locomotive or baggage car out on one side of the train, through the rear cross pipe, and back on the other side to the water tank of the tender, as shown in the plan above.

Digitized by Google

Fig. 2 is a perspective view of a passenger car provided with a reservoir to be charged from a steam generator at the stations. The reservoirs *A*, of which there may be several on each side of the car, though our sketch shows but one, are strong iron cylinders, partly filled with water, as indicated by *W* in the part broken away to the right. The cylinders contain a small pipe *D*, which makes several turns on itself, entering near the bottom, and leaving near the top as shown. The upper portion of this pipe, above the water level, contains a number of small openings, *d*, by which communication is established between the reservoir and the interior of the pipe which makes a complete circuit on one side of the car, the reservoirs on each side having their independent circuits, but being connected by cross pipes under the floor, not shown in the sketch, through which they are charged from the generators.

The operation is as follows: The reservoirs are charged under pressure from the generators at the stations. Circulation then goes on around each side of the car, steam continuing to form until the temperature and pressure have reached the boiling point.

Lieut. Graydon's patent includes many other details. A flexible metallic connection between cars has been designed, which consists of several ball and socket joints together with a screw coupling of peculiar construction. The ball and socket joints are made tight by spring rings, tension screws and packing, which prevent escape of steam, while allowing free play to the joints. A coupling is also devised which is intended to couple automatically when two cars come together, the shock at the same time opening valves for the circulation of steam through the pipes. When cars are to be detached the steam pipes uncouple automatically, and the valves close by the pressure of the steam.

Construction Notes.

We shall always be glad to receive items of interest for this column.

CHICAGO.—In response to the city's re-advertisement for furnishing hydrant and stop valve castings, the following bids were put in, the first named being awarded the contract December 20; John H. Bass, $47. a ton; Union Foundry & Pullman Car Wheel Works Co., $47.50; Marshall & Miller, $48.50; Jno. Featherstone, $55.

HAVERHILL, MASS.—The contract for rebuilding portion of wrought iron bridge over the Merrimac River has been awarded to the Boston Bridge Company for $10,450. The King's Bridge Company of Ohio submitted a bid at $11,964.

HYDE PARK, ILL.—At the second meeting of the Board of Trustees, Dec. 4, the following bids for furnishing water pipe were opened. Dennis, Long & Co., 1400 feet of six-inch cast iron water pipe at $40 per ton of 2000 pounds; A. H. McNeal, 1400 feet of six-inch cast iron water pipe at $42 per ton of 2000 pounds; Cincinnati and Newport Pipe Co., 1400 feet of six-inch cast iron water pipe at $38 per ton of 2000 pounds. The contract was awarded to the Cincinnati and Newport Iron and Pipe Co. The contract for laying the pipe was awarded to Michael Philbin at 34 cents per lineal foot.

PHILADELPHIA.—An ordinance authorizing the Mayor to enter into a contract for lighting Chestnut street with the electric light for $10.000, was on the 12th inst., referred to a sub-committee of the Council Committee on Gas.

—The Council Committee on survey have reported favorably on the construction of a three-foot sewer on Mountain street.

—F. T. Walton, better known as "Plunger" Walton, of New York City, has offered to clean the streets of Philadelphia for $500,000 per year, providing that the city will give him a contract for five years. He will expend $200,000 in machinery, to perform the work properly, and will deposit $100,000 as a guarantee fund to be drawn on by the controller to pay for the doing of such work as he does not do according to contract.

CHICACO.—The following bids for hydrants and stop valve catchings were opened the 7th inst.: J. H. Barr, $49.50 per ton; Union Foundry & Pullman Car Wheel Co, $50; Clark, Raffen & Co., $54.

James H. Roche was awarded the contract for laying water service pipes in Rush Street, from Ohio to Erie Streets.

SOUTH NORWALK, CT.—Proposals for the construction of an iron swing bridge over the Norwalk River at South Norwalk, Ct., will be received by W. H. Earle, Chairman of the Bridge Committee, until January 11.

TOLEDO, O.—The following is a synopsis of bids received for rolled iron beams, for first story floor for custom house, etc., at Toledo, Ohio:

1.	M. Clements	$3,714 22
2.	The Smith Bridge Co.	3,749 61
3.	McHose & Lyon	3,917 00
4.	Snead & Co. Iron Works	4,120 36
5.	Haugh, Ketcham & Co.	4,306 02
6.	Russell Iron Works	3,820 36

The bid of M. Clements has been accepted.

GREENFIELD, MASS.—The matter of increasing the water supply was brought before a public meeting, Dec. 5, at which the report of the committee was considered. They, "after making a thorough study of the whole question and examining the various sources of supply and the matter of enlarging the Glen reservoir, unanimously recommend this plan: Raise the dam at the Glen six feet, involving an expense of about $4,000; build a reservoir on Rocky mountain, east of the village, which would be 168 feet above the arch on Main street; run a pipe from the Glen water pipe to this reservoir, which could be filled during the night, and used for fire and mechanical purposes. By this plan the total expense, including the raising of the dam, would be about $34,000." —*Springfield Republican.*

CINCINNATI.—The Committee of the Board of Councilmen will recommend that the contract for removal of garbage, dead animals, and animal and slaughter house refuse, be awarded for ten years to the Fertilizing Company, for $12,500 per annum, to be paid by the city.

BROOKLYN.—The contract for the Brooklyn Navy Yard sewer has finally been awarded to Charles Hart for $97,800. The lowest bid, that of Michael Tobin ($65,550) was rejected and the contract then awarded in turn to the next two higher bidders, John Brady ($79,500) and Friel & McNamee ($88,125), both of whom failed to qualify.

BOSTON, MASS.—Referring to the dispute over the bids for plumbing materials for the Boston, Mass., Sub-Treasury and Post Office, opened by Thos. Brown, Supt., the Treasury Department has determined to adhere *to the terms of its advertisement* and has awarded the contract for plumbing materials to Messrs. Dalton and Ingersoll, at their bid of $10.095.34, nothwithstanding a bid was filed by Messrs. Phillips and Weeden of $9,924.36, after the hour for closing the bids—12 M.

In the matter of fire-proof shutters for the C. H. and P. O., Cincinnati, Ohio (list of bids reported Dec. 15, 1882) department states that it will require some two or three weeks to manufacture the shutters, and prepare to make the test of same, and until such action is taken, no award will be made.

PADUCAH, KY.—The contract for plastering the Court House and Post Office, will be awarded to Jas. Eastman, at $2,450.00.

RAPPAHANNOCK RIVER Bids were opened Dec. 21, for dredging in Rappahannock River, Va., Urbana Creek Va., and St. Jerome Creek, Va., as follows:

	Rappahannock River.	*St. Jerome Creek*	*Urbarna Creek*	*Total*
Dan'l Constantine.	$21,000.00	Cut A & B $6,318.00	$3,750.00	$31,068.00
Potomac Dredge Co.	19,860.00	Cut A & B 12,639.00	6,222.22	38,721.22
Mack Bowen.	23,875.00	No bid	6,875.00...	.....
Henry Birch.....	21,000.00	No bid	6,750.00	.....
Geo. E. Ward.....	26,000.00	Cut A & B 6,572.28	6,500,00	39,072.28

Dan'l Constantine being the lowest on all work, is awarded the contract.

ROCHESTER, N. Y.—The contract for the wrought iron bridge on Lyell avenue was awarded Dec. 22 to the Hudson River Works, Hudson, N. Y., at $10,990.

NEW YORK.—The day for opening the street cleaning bids has been postponed from the 26th to the 30th inst., in consequence of an injunction granted by Judge Van Brunt restraining Street Commissioner Coleman from awarding contracts.

In consequence of charges made against them, the Board of Health of Cincinnati have demanded an investigation by the Board of Councilmen.

A factory has been opened at New Orleans to make illuminating and lubricating oil out of cotton seed *Memp. Appeal.*

Building Intelligence.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

Notes and Abstracts.

During the week ending December 16 the annual mortality rate in 34 United States cities (San Francisco return of previous week included) having an aggregate population of 7,219,930, was 22.3 per 1,000, identical with the rate reported from the large cities of England for the week ending December 2. The unusual prevalence of diphtheria in this country is inferred from a comparison of the deaths caused by it with the number registered in England. On the other hand the mortality from measles is greater in England.

Boston, Philadelphia, St Louis, Detroit and St. Paul record a large mortality from diphtheria.

In proportion to population, Buffalo gives the largest number of deaths from scarlet fever.

One-half of the 32 deaths from measles reported from the 34 cities occurred in Albany, N. Y.

The mortality from small-pox has risen considerably during the week, 27 deaths having taken place as against eight during the previous week. Deaths from this disease were reported from Philadelphia and Pittsburgh, Pa., Chicago, Ill., Louisville, Ky., Nashville, Tenn., New Orleans, La., and Minneapolis, Minn.

ATLANTA, GA.—Dr. James B. Baird reports a case of small-pox, the contagion having been imported from Chattanooga, Tenn.

NEW ORLEANS, LA.—The report for the week ending December 9 did not arrive in time for last week's issue. Total deaths, 131; white 84, colored 47; under five years 31, white 21, colored 10. Accidents caused eight deaths, small-pox four, typhoid fever four, malarial fevers 10, consumption 17, croup one, pneumonia nine, diarrhœa nine, dysentery six and puerperal convulsions one death.

FULTON, ILL.—Dr. G. W. Clendenen reports the city in good sanitary condition.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin's report shows four admissions, 12 discharges, two deaths and 1,339 remaining under treatment.

LOUISVILLE, KY.—Dr. E. R. Montgomery reports 12 cases of small-pox, all of which were sent to hospital, except one isolated at house and the house flagged.

DETROIT, MICH.—Dr. O. W. Wight reports 20 cases of scarlet fever and 34 of diphtheria.

BOSTON, MASS.—C. E. Davis, Jr., City Clerk, reports 44 cases of diphtheria, 22 of scarlet fever, and seven of typhoid.

NANTUCKET, MASS.—J. T. Burr, Clerk, reports a case of small-pox.

MINNEAPOLIS, MINN.—Dr. J. C. Cockburn, Health Officer, reports under date of 16th inst., that there are 18 cases of small-pox in the city.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 12 new cases of scarlet fever, and nine of diphtheria, which with those carried over from last week, make 38 of scarlet fever and 13 of diphtheria remaining under treatment.

PITTSBURGH, PA.—Dr. Snively reports one new case of small-pox during the week.

Digitized by Google

HUDSON CO., N. J.—The report for the week ending December 9 was not received in time for our table in last issue. Eighty-four deaths were recorded, of which number 51 were under five years of age. Accidents caused two deaths, consumption 14, croup nine, diphtheria six, cerebro-spinal fever four, intermittent fever two, measles three, whooping cough one, bronchitis five and pneumonia 13 deaths.

MICHIGAN.—Dr. Henry B. Baker, Secretary State Board of Health, reports the prevailing diseases in the State during the week ending December 9 as follows: neuralgia, rheumatism, bronchitis, intermittent fever, tonsilitis, consumption, remittent fever and pneumonia. Intermittents, influenza, tonsilitis and pneumonia extended their area. Diphtheria and scarlet fever were reported present at 16 places, and measles at four places. Small-pox was not reported from any locality in Michigan.

PORT OF NEW YORK.—The report of Dr. Hanor, National Board of Health Immigrant Inspector, shows the arrival of 6,640 immigrants during the week ending December 9. Of this number 179 were vaccinated at quarantine.

DETROIT, MICH.—Dr. Mulheran, Immigrant Inspector, reports 749 arrivals during the week ending December 9. Of these 90 were vaccinated at the station.

PORT HURON, MICH.—Dr. H. R. Mills reports for the week ending December 9 the arrival of 755 immigrants, of whom 517 required vaccination.

BALTIMORE, MD.—Jas. A. Stewart reports the arrival of 858 immigrants during the two weeks ending December 15. Only three required vaccination.

ONTARIO, CANADA.—The Bulletin issued by the Provincial Board of Health shows the following diseases as prevailing during the week ending Dec. 9.: bronchitis, neuralgia, influenza, diphtheria, tonsilitis, anæmia, and consumption.

SANTIAGO DE CUBA.—The consular report for the month of Nov. shows 123 deaths, of which 42 were caused by yellow fever. The 42 deaths occurred among 51 cases of the disease. The harbor and its vicinity is reported as being free from infection.

PERNAMBUCO, BRAZIL.—Consul H. L. Atherton reports six deaths from small-pox during the week ending Nov. 5. Pulmonary complaints are reported prevalent, and many cases of titanus are said to have occurred.

RIO DE JANEIRO, BRAZIL.—Consul General Jas. H. Murray reports 253 deaths for the week ending Nov. 18; of these 61 were caused by small-pox, seven by pernicious fever, and 41 by consumption.

BUENOS AYRES, ARGENTINE REPUBLIC.—Consul E. L. Baker reports for the month of September 35 deaths from small-pox, four from diphtheria, and two from scarlet fever. The city is reported as in bad sanitary conditions and fears are entertained of a large increase in the death rate in view of the approach of warm weather.

VALPARAISO, CHILE.—Vice Consul August Möller, Jr., sends report for Oct., showing 561 deaths in a population of 100,000. Small-pox caused 26 deaths during the month.

ENGLAND.—Cousul General E. A. Merritt sends the return of the Registrar-General for the week ending December 2. The death rate was lowest in Bolton, 14.7; highest in Newcastle-upon-Tyne, 28.6; average rate in 28 towns, 22.3; rate in London, 21.5 per 1,000. Small-pox caused five deaths in London, four in Newcastle-upon-Tyne, and one in Nottingham.

SCOTLAND.—Consul J. A. Leonard transmits report of Registrar-General, week ending December 2. Death rate in the eight principal towns, 24.8; lowest in Greenock, 14,8; highest in Perth, 29 3 per 1,000.

IRELAND.—The Registrar-General's return for the week ending November 25 was received too late for tabulation in our last number. There were 472 deaths in the 16 city districts, giving a rate of 29.1 per 1,000, No deaths from small-pox were registered. Measles caused 12 deaths, scarlet fever 16, typhus fever five, whooping cough 12, diphtheria one, enteric fever nine, consumption 40, and diseases of the respiratory system 127.

The return for the week ending December 2 shows 476 deaths in the 16 urban districts, and the occurrence of a fatal case of small-pox in Londonderry.

DUBLIN, IRELAND.—The report of Dr. Chas. A. Cameron, for the four weeks ending October 28 shows 582 deaths, giving a ratio of 21.7 per 1,000 persons living. The deaths from zymotic diseases fell off considerably as compared with the previous month. There were 40 deaths from diarrhœal diseases in September, and only eight in October. Typhus declined from seven to five, and there were no deaths during October from diphtheria, scarlet fever, or measles. Whooping cough, however, increased from six to 11.

ROTTERDAM, NETHERLANDS.—Consul John F. Winter reports, for the week ending December 2, the occurrence of three deaths from small-pox, and two from measles. The latter disease is said to be prevalent.

AMSTERDAM, NETHERLANDS.—Consul D. Eckstein reports 189 deaths during the week ending November 25, in a population of 342,000. No deaths from small-pox were registered.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 86 deaths for the week ending Nov. 18. Of these two were caused by bronchitis, ten by pneumonia, 17 by consumption, one by measles, seven by scarlet fever, six by diphtheria and three by typhoid. Annual rate 25.6 per 1,000.

COPENHAGEN, DENMARK.—Consul H. B. Ryder sends reports for the weeks ending Nov. 14 and 21. During the former there were 108 deaths, of which one was caused by measles, five by scarlet fever, one by croup, two by whooping cough, five by diarrhœa and one each by puerperal fever and erysipelas. No cases of small-pox were recorded but there were 13 cases of measles, 21 scarlet fever, ten diphtheria, one croup, 21 whooping cough, 15 typhoid fever, 99 diarrhœa, 16 erysipelas, two puerperal fever. During the latter week there were also 108 deaths, two of which were caused by measles, two by croup, three by whooping cough, two by typhoid fever, two by diarrhœa and one by erysipelas. Cases reported as follows: measles, 20; scarlet fever, 58; diphtheria, 9; croup, two, whooping cough, 50; typhoid, 15, diarrhœa, 99; erysipelas, 24. Bronchial catarrhs, tonsilitis and gonorrhœa are the prevailing diseases, there having been recorded of these 374, 140 and 128 cases.

BRUSSELS, BELGIUM.—During the week ending Nov. 25, the deaths in the city and its faubourgs numbered 166, of which 70 were under five years of age. No deaths occurred from measles, scarlet fever, whooping cough, diphtheria or small-pox; croup caused three deaths typhoid fever two, diarrhœa 26, acute lung diseases, 24 and consumption 25 deaths.

RHEIMS, FRANCE.—Consul John L. Frisbie reports 36 deaths for the week ending Nov. 27. No deaths were registered from small-pox, typhoid fever, scarlet fever or whooping cough. Measles caused one death and croup two deaths. Mr. Frisbie says that owing to the scarcity of work for the laboring classes, about 2,000 of whom are now out of employment, much destitution prevails, and fears have been entertained of an increase in the death rate by reason of exposure and privation, but happily as yet these have not been realized.

VENICE, ITALY.—The bulletin for the week ending Nov. 25 shows the occurrence of 68 deaths, equal to an annual rate of 26.4 per 1,000 living. The birth rate for the week was only 25.4. No deaths from small-pox, measles or scarlet fever. Croup caused one death, typhoid fever one, diarrhœal diseases ten, consumption ten and acute lung diseases ten deaths.

ST. PETERSBURG, RUSSIA.—Consul Gen. Edgar Stanton reports 568 deaths during the week ending Nov. 18. Of these 244 were under five years of age. Small-pox caused 21 deaths. Population 927,467.

SMYRNA, TURKEY.—Consul W. E. Stevens reports on November 24 that the small-pox epidemic in Smyrna and its environs has increased and become more virulent. The hospitals are filled with cases of the disease and there is no immediate prospect of improvement. Not even approximate figures of the deaths from the disease can be given, as no mortuary or sanitary statistics are kept by the authorities and none of any value are procurable from other sources. No precautions are taken to prevent the spread of the contagion. Even the ghastly practice of conveying dead bodies through the streets with the coffin lid removed and the corpse exposed to full view, held aloft on the shoulders of the bearers, is persisted in. Vaccination is general among European residents, but at this time there is a want of good vaccine matter. Efforts have been made by the physicians to persuade the authorities of the province to provide vaccine matter for the poor, they offering to apply it gratuitously, but the reply is that there is no money in the treasury.

MADRAS, BRITISH INDIA.—Consular Agent L. Strange reports 238 deaths during the week ending November 10, equal to a rate of 31.1 per 1,000. Small-pox caused five deaths; fevers 58; dysentery 17, and diarrhœa 12. No deaths from cholera are reported.

CALCUTTA, BRITISH INDIA.—Consul General H. Mattson reports for the week ending November 4 the occurrence of 256 deaths, of which 37 were caused by cholera, 77 by fevers, 26 by bowel complaints, 14 by tetanus. Annual rate 30.8 as compared with 33.6 during the previous week. Cholera is reported as sporadic but somewhat over average in prevalence.

PENANG, INDIA.—During the month of September 90 deaths occurred from fever, 23 from small-pox and two from cholera. The authorities are alive to the danger from cholera and have adopted all measures of precaution in doubtful or suspicious cases. The natives do not look favorably on vaccination, as they believe it to be productive of attacks of the disease which it is intended to prevent. The practice of inoculation gave rise to this idea.

THE INSPECTOR AND THE HOUSE OWNER.

One of our exchanges, published at a famous health resort near this city, prints a dialogue between a house owner and a health inspector which is too good to be buried in the waste paper basket. Mr. House Owner is inclined to object to the visit of the Health Inspector who finds a wooden privy vault on his premises, in violation of the local ordinance. "Confound your ordinance and Board of Health and Commissioners!" he says, "Why won't you let me alone? The town is getting to be a little too clean a place to suit me. I'm ready to sell out. You restrict my liberties entirely too much. I must make a water tight privy vault; throw no kitchen slops on the ground; keep my children away from day school and Sunday school for a month or two if they happen to have the measles or scarlet fever, etc. Yes, I'm ready to sell out."

H. I., "All right; I'll venture to say you will find a purchaser at once; for of course you will sell for cost."

"H. O., "Oh, no! my lot is worth four times the price I paid for it six years ago."

H. I., "Then the rules you object to have not depreciated the value of your property? Perhaps on reconsideration you may take a different view of the matter, and conclude that wise sanitary precautions are not injurious after all, but on the other hand they are essential to the prosperity of a health resort. People who visit us come here and *improve* their surroundings, and they will certainly pass us by unless everything relating to hygiene and sanitation is an improvement upon that which they are accustomed to at home. Cesspools and privy vaults of the leaking pattern will hardly satisfy the requirements of the modern health seeker; besides, you are altogether out of fashion, as only eleven other wooden vaults still exist in the borough. Good day. I'll be round again soon."

Tables showing the number of new patients at six New York City dispensaries for the week ending Dec. 9, 1882, with some of the principal acute diseases.

These tables show that during the week 898 cases of acute diseases received attention, and that of these nearly one-half were cases of acute lung disease. One case of diphtheria, eight of measles and one of typhoid fever are reported. The proportion of cases reported as malarial fever continues high.

Dr. Edward Sargeant, Medical Officer of Health for Bolton, in his report on the health of that borough for the year 1881, states that there were registered during the year 3,811 births and 2,022 deaths. The population, in census of 1881, amounted to 105,414. Infectious diseases had a limited prevalence, giving rise to 469 reported cases, of which 61 proved fatal. The high death rate from the zymotic diseases reported is most probably due to the fact that not unfrequently a medical man is not called in until the case proves severe or complications arise. The mild cases treated without medical aid are not reported. He states that his experience is that the desire for concealment is rare, and he knows of no instance where medical advice has been delayed from fear of notification to the sanitary authority. In his examination of articles under the sale of the Food and Drugs Act he found adulteration in 28 per cent. of the samples submitted, most of these were in cases of milk.

The farmer's convention at Rockville, Ct., week before last directed some attention to the ventilation of stables. Dr. G. A. Bowen, of Woodstock, made a strong plea for the better ventilation of farm buildings, particularly of barns. Some of the old-fashioned barns may have had too much ventilation for comfort, but the other extreme is reached when warmth is furnished at the expense of air. Cattle that constantly inhale the deleterious odors of the manure heap suffer ultimately in health and lose their vigor. He would have no cellars under house or barn, unless lighted and ventilated by windows. In the discussion following, Prof. Brewer, of New Haven, claimed that a double shaft was the only proper way to ventilate a close stable. With a furnace in a cellar, one flue will answer. No stable is perfect without dry earth as a deodorizer.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

264,522. STEAM-TRAP. BARRENT W. FELTHOUSEN, Milwaukee, Wis. Filed May 23, 1882. (No model.) Issued September 19, 1882.

Claim.—1. A steam-trap provided with a movable tank attached to the float, arranged and constructed so as to alternately receive and discharge water, and by its consequent change of weight render the movements of the float more positive, for the purpose already described.

2. A steam-trap provided with a movable tank connected to the float furnished with an inlet and outlet pipe and a valve at the top, substantially as and for the purposes set forth.

3. A steam-trap provided with a tank attached to an open-top vertical float.

4. A steam-trap provided with a steam and relief valve, with a partition in the cover that separates the two valves, substantially as described.

5. The combination in a steam-trap, of the lever P, bevelled rollers O O, float B, and valve-spindles adapted to be rotated whenever they are opened, substantially as and for the purposes set forth.

6. In combination with a steam-trap, an inwardly-opening check-valve, J, situated in the discharge-pipe below the discharge check-valve V, and leading into the body of the trap above the line R R, substantially as and for the purposes set forth.

7. In a steam-trap, the combination of the rod E, attached to float B, and provided with roller K and lever P, forked for the reception of the roller, so as to prevent all lost motion, substantially as and for the purposes set forth.

8. In a steam trap, the combination of the steam-valve H, relief-valve U, the check-valves X and V, float B, tank C, rod E, guide-pipe and passage D, all constructed and arranged substantially as and for the purposes set forth.

264,568. FURNACE FOR PRIVIES. WILLIAM S. ROSS, Madisonville, Ky. Filed May 11, 1882. (No model.) Issued Sept. 19, 1882.

Claim.—1. As an attachment for a privy, a horizontal metallic casing constituting the depository for the fecal matter, and provided with the hinged lids and fire chamber, substantially as set forth.

2. The attachment for a privy, consisting of the horizontal metallic casing with the perforated false bottom C, bridge-wall *b*, and grate bars *a*, arranged in about the same horizontal plane with the hinged lids E, and doors communicating with the grate surface, substantially as set forth.

3. The combination, substantially as hereinbefore set forth, of the horizontal casing A with the perforated false bottom C, grate-bars *a*, bridge-wall *b*, hinged lids E, the metallic frame E[1], privy box with hinged seats, and the connecting means.

4. A privy box having its front lined with metal and formed with a support, *e*, for the lid of the deposit chamber, in combination, with the deposit chamber of a furnace, substantially as set forth.

264,693. WATER CLOSET. JAMES HAY and ROBERT H. LECKY, Allegheny, Pa. Filed Jan. 10, 1882. (No model.) Issued Sept. 19, 1882.

Claim.—1. In a water closet of the described class, a bowl, A, having a neck, B, depending vertically from the centre of the bottom thereof with its lower edge inclined, in combination with a swinging valve, C, adapted to close against said inclined lower edge, substantially as described.

2. In a water closet provided with a flooding cistern and having a valve closing against the lower edge of the neck and opening downwardly and away to one side of the neck or trunk, an opening *k*, into the neck from the cistern at a point above and opposite the valve, substantially as described, whereby a jet in flooding impinges directly upon said valve and cleanses the same.

3. The combination with the valve and the pull-rod, of two interposed toggles, *f f*[1], having the locking abutments *h*, substantially as described.

4. The combination with the neck B, valve G, and rod *i*, of the interposed toggles *f f*[1], having abutments *h*, the arms *c*, shaft *b*, and cranks *e*, substantially as described.

5. In a water closet, the bowl A, having central vertical neck B, cistern C, overflow pipe D, trap *m*, and air vent *n*, all in one integral piece, substantially as described.

6. In a water closet, the bowl A, having formed integral therewith the pull socket E, substantially as described.

264,573. FAUCET. JOHN H. SEABURY, Hempstead, N. Y. Filed July 22, 1882. (No model.) Issued Sept. 19, 1882.

Claim.—The combination, with the barrel A, having a taper seat and elongated or enlarged general delivery opening, *g*, the nozzle *b*, and cold and hot water inlets *e f*, of the taper rotating plug B, provided with an upper through transverse passage, *h*, and with duplicate oblique intersecting through passages, *i i*[1], substantially as and for the purposes herein described.

263,881. GAS AND LAMP BURNER. ELIAS B. REQUA, Jersey City, N. J. Filed July 15, 1882. (No model.) Issued Aug. 29, 1882.

Claim.—The combination, with a burner for gas or oil, of a perforated platinum ribbon located over the burner, substantially as described.

2. The combination, with a burner for gas or oil, of a perforated platinum strip or ribbon extented over the burner, and a deflector for deflecting the upwardly-induced currents of air into the flame for heating the platinum strip or ribbon, substantially as described.

3. The combination, with a burner for gas or oil, of a platinum strip or ribbon extended traversely over the burner in the plane of the flame issuing therefrom, and of a bowed or similar shape which approximates the contour or form of the flame, substantially as and for the purposes described.

4. The combination, with the burner, of the platinum strip located over the same, the deflector for deflecting upwardly-induced air-currents into the flame, the perforated base, and a glass flame protector I, substantially as described.

5. The combination, with a burner for gas or oil, of a platinum strip or ribbon extended transversely over the burner in the plane of the flame issuing therefrom, and non-conducting supports for sustaining the ends of the platinum strip or ribbon, substantially as and for the purposes described.

6. The combination, with a burner, of the slotted deflector G, the perforated base H, and the platinum strip located over the burner, and having its ends secured in the glass tubes D, which are held in sockets supported from the burner, substantially as described.

263,863. COUPLING FOR TUBING. EDMUND C. CONVERSE, Pittsburgh, Pa. Filed June 12, 1882. (No model.) Issued Sept. 5, 1882.

Claim.—1. In couplings for tubing, the combination, with tubing having one or more lugs or other connecting devices at or near each end thereof, of a coupling collar or sleeve provided on the interior with a central ring, corresponding locking seat or seats on each side of said ring for the reception of the lugs on the tubing, and annular calking recesses between such locking seats and the ends of the collar substantially as and for the purposes set forth.

2. In couplings for tubing, a coupling collar or sleeve provided on the interior with a central ring, an annular calking recess at each end for the reception of calking material, and a series of wings extending across the mouth of each annular recess, where the wings are substantially triangular in shape, to permit the calking of the material underneath said wings, as and for the purposes set forth.

264,801. UTILIZATION OF BY-PRODUCTS IN THE MANUFACTURE OF COAL GAS. ROGER W. WALLACE and CARL F. CLAUS, London, England, assignors of two-tenths to William Freeman Jack and Ebenezer Stewart, same place; said Wallace assignor of his remaining right to said Claus. Filed July 25, 1882. (No specimens.) Patented in England, Jan. 20, 1877, No. 273. Issued Sept. 19, 1882.

Claim.—1. The process of purifying gas by separating ammonia from the ammoniacal liquor, consisting of treating the said liquor with chloride of sodium and carbonic acid, as specified, and then separating the chloride of ammonium from the solution, and finally decomposing the chloride of ammonium by lime, thereby reproducing pure ammoniacal gas.

264,835. HEATING APPARATUS. JONATHAN JOHNSON, Lowell, Mass. Filed Mar. 3, 1882. (Mo model.) Issued Sept. 19, 1882.

Claim.—1. The combination, in a hot water or steam heater, of an annular water chamber, provided with vertical connecting pipes, a central interior case or water chamber exposed to the direct action of the products of combustion, vertical water pipes exterior to the furnace case, and lateral tubes connecting the exterior pipe with the lower annulus and with the upper water chambers, said lateral tubes being arranged to connect with said upper chambers, respectively, at a point near the top and a point near the bottom thereof, whereby the chambers are constantly supplied with water, substantially as set forth.

2. The combination of the lower casing A[1], upper concentric shells or casings, B[1] B[2], lower annular water chamber D, arranged within the inner casing and adapted to serve as a fire-pot, upper annular water chamber F, vertical pipes E, connecting said annular chambers inner water chamber, G, vertical pipes, H, exterior to the furnace and connected with the inner water chambers by means of lateral pipes, and the flue I, communicating with the lower part of the furnace below the level of the fire-pot, whereby all the chambers are constantly supplied with water and the products of combustion are carried up over the inner faces of said chambers and downward over their outer faces, substantially as set forth.

3. In a heating apparatus, the combination of the lower annular water chamber, D, upper annular chamber, F, vertical pipes E E, connecting said chambers, central water chamber, G, supported at the upper part of the apparatus, vertical water columns H H, exterior to the furnace shell, and provided with inlets *p p* and exits *t t*, the horizontal pipes *d*, connecting the water columns with the lower annulus, and other horizontal pipes, respectively, connecting said columns with the upper annulus and with the central chamber both at a point near the top and a point near the bottom thereof, substantially as set forth.

4. In a heating apparatus, the combination of the lower shell or casing, A[1], plate A[2], supported thereon, and having draft openings *b*[1] *b*[1], upper concentric furnace shells, B[1] and B[2], annular water chambers D and F, connected by vertical pipes E E, central water chamber, G, vertical water columns H H, connected by lateral pipes with the inner water chambers, and the smoke pipe I, communicating with the lower part of the furnace below the level of the fire-pot, substantially as set forth.

5. In a heating apparatus, the combination, with the inner water chambers, D, F and G, and exterior water columns H H, having inlets *p p* and exits *t t*, of the steam separating radiator K M, having perforated plates M[1], eduction pipes O, and return pipe N, substantially as set forth.

264,899. SUPPORT FOR ELECTRIC LIGHTS AND CONDUCTORS. GEORGE H. ALLEN, Boston, Mass. Filed May 16, 1882. (No model). Issued Sept. 19, 1882.

264,642. ELECTRIC DISTRIBUTION AND TRANSLATION SYSTEM. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 9, 1880. (No model.) Patented in England Sept. 24, 1880, No. 3,880; in Canada Nov. 15, 1880, No. 11,997; in Italy Nov. 19, 1880; in Belgium Nov. 30, 1880, No. 53,018; in France Jan. 3, 1881, No. 139,588; in Victoria Jan. 4, 1881, No. 2,944; in Austria Feb. 3, 1881; in New South Wales March 7, 1881; in New Zealand March 7, 1881, No. 512; in Queensland March 9, 1881; in Spain April 2, 1881, and in India July 20, 1880, No. 528. Issued September 19, 1882.

264,643. MAGNETO-ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed May 12, 1879. Patented in Belgium June 16, 1879, No. 48,341; in England June 17, 1879, No. 2,402; in Italy June 23, 1879; in Victoria Aug. 16, 1879, No. 2,685; in France Aug. 25, 1879, No. 130,910; in Sweden Sept. 24, 1879; in Spain Oct. 4, 1879; in Norway Jan. 20, 1880; in Austria-Hungary Jan. 22, 1880; in Denmark June 11, 1880, and in Germany Feb. 7, 1881, No. 12,033. Issued Sept. 19, 1882.

264,646. DYNAMO OR MAGNETO ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Nov. 28, 1881. Renewed Aug. 14, 1882. (No model.) Issued Sept. 19, 1882.

264,647. DYNAMO OR MAGNETO ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Oct. 4, 1881. (No model.) Issued Sept. 19, 1882.

264,648. DYNAMO OR MAGNETO ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Nov. 11, 1881. (No model.) Issued Sept. 19, 1882.

Digitized by Google

"The able bodied sewer gas," as a correspondent has termed it, which has roamed at will in the Chicago jail has been investigated by a committee containing several architects. It would appear that they were deeply impressed with the odors, and will recommend radical changes in the ventilation. This has brought the Chicago *Tribune* to its defence with the claim that the ventilation and the plumbing are of the best, and smells were only noticed because the ventilating fan was not running since it entailed extra labor on the engineer. If this be so the management and not the odors would appear to need looking after.

The village of East Chester is going to oppose, to the best of its ability, Mt. Vernon's effort to discharge sewage into Hutchinson river. At a meeting of citizens last week a committee was appointed to collect funds to secure counsel to oppose the bill which Mt. Vernon will seek to have passed by the State Legislature. A petition will also be drawn up and sent to the State Board of Health asking them to oppose the construction of the proposed sewer.

"Experience teaches us," says the Hartford Steam Boiler and Inspection Company, "that nine-tenths of the boiler explosions in the country are attributable to carelessness on the part of engineers, or to the cupidity and avarice of the owners, who, to save the expense of additional boiler power, will order their boilers to be run at excessive and dangerous pressures."

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

THE undersigned respectfully announces that on January 1st, he will begin practice as

Consulting Mechanical Engineer.

at 96 Fulton St., his specialty being Steam Heating and Ventilation. The experience acquired during 20 years' practice, is at the service of those who may employ him. In the matter of preparing plans and specifications for Steam work, and advising on the respective merits of proposed plans, he hopes to be useful to owners, architects, and users of steam. Very respectfully,

AUTHOR WM. J. BALDWIN.

"*Steam Heating for Buildings.*" Mem. Soc. Mech. Eng.

A valuable holiday present for a faithful employee: the fifth and sixth volumes of THE SANITARY ENGINEER, bound in cloth, or either of them.

If he reads them to any purpose he will be more useful, and your present will increase in value as it grows older.

5th Vol. $4.00. 6th Vol. $3.00.

Pure Sugar.

In order that the public can get sugar pure and in the condition leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Reliable Food Products.

Great progress has been made, within a few years, in manufacturing food products, and the standard of quality has been raised to a point far beyond that which formerly obtained. We claim that this has, to a considerable extent, been due to our efforts. As the Largest Manufacturers and Dealers in the world in this line, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.,

Importers, Manufacturers, and Dealers in all varieties of Food Products; New York, London, and Bordeaux.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so-called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

Employment Wanted.

Under this head we will insert advertisements, not exceeding four lines, free of charge, for persons seeking employment. This privilege is restricted to persons employed by Architects, Civil Engineers, Chemists, Electric Light Companies, Gas Companies, Plumbers and those engaged in the business of Heating by Hot Air, Hot Water and Steam.

BY MECHANICAL Draughtsman perfectly familiar with perspective work. Good references.
J. T. C., 43 King St., New York City.

A FIRST-CLASS Plumber with 9 years' Boston and New York experience, wants steady work. No objection to country.
Address, A. K., this office.

AN A-1 Plumber wants a steady job.
Address, F. McC., office Sanitary Engineer.

A JOURNEYMAN Plumber, with 20 years' experience, best N. Y shops, wants a job in either city or country.
Address, M. K., care of THE SANITARY ENGINEER.

A GENTLEMAN, thoroughly familiar with Plumber's Materials, desires a situation with some good house, either on the road or in the office. Can furnish the highest reference.
Address, A. B. C., THE SANITARY ENGINEER Office.

WANTED:—Young man with two years' experience at Engineering and Draughting, college graduate science department, desires situation as Assistant Engineer, Surveyor or Draughtsman, or sit with Architect or in similar employment. References.
Address, B. F. CHANDLER,
Boston, Mass.

A JOURNEYMAN Plumber, with 16 years' experience, wants work in or around New York.
James Hagan, 535 Washington St., N. Y.

A JOURNEYMAN Plumber of 12 years' standing, wants work in or near New York City. Address,
Jno. Stanton, 179 W. Houston St., N. Y.

PLUMBER wants situation, city or country. Only left last place Nov. 18th. Refers to Bixby & Woods, Conncil Bluffs, Iowa, also parties in this city. Address, T. P., Office Sanitary Engineer.

DESIGNER and Mechanical Draughtsman desires engagement. Thoroughly acquainted with Process work, also Architectural and Engineering work. Louis C. Denis, Jr., 291 Pearl St., N. Y.

A COMPETENT Sketch Artist desires employment. Prefers some city engagement.
Address, W. H. S., this office

A PRACTICAL Steam Fitter of 27 years' standing seeks a position. Address, Jno. Hughes, 315 10th Av., N. Y.

A STEAM Fitter, who has been in the business 15 years, wants a situation. No objection to going out of city.
Francis Boyle, 158 W. 28th St., N. Y.

A DESIGNER and Mechanical Draughtsman, (who is also familiar with sketching for engravers), desires a permanent position.
Address, Designer, 78 Day St., New Haven. Conn. (Ca. S.)

Proposals.

Dredging harbor and furnishing pine and hemlock timber for breakwater. Until Jan. 10, 1883. Address, W. H. H. BENYAURD, *Major of Engineers*, U. S. Engineer Office, Chicago, Ill.

Furnishing supplies of cotton rope for tests. Until Jan. 15, 1883. To be delivered in New York Navy Yard. Address, Hon. WILLIAM E. CHANDLER, *Sec'y of the Navy*, Navy Department, Washington, D. C.

Building monument at Yorktown, Va. Until January 4. Address RICHARD M. HUNT, Tribune Building, N. Y. City.

Erecting Brick School Building at Kiowa, Comanche, and Wichita Agency. Until Dec, 28. Address P. B. HUNT, *U. S. Indian Agent*, Anadarko, Ind. Ter.

THE BELL WATERPHONE COMPANY,

Sole Proprietors of the invention for the prevention of the

Waste of Water, the Discovery of Leaks in Water Craft, and the Detection of Defects in Mechanical Movements.

It is specially adapted to the use of Plumbers, and for Water Works.

This system of waste prevention has been in successful operation at Cincinnati for the past twelve months, and during this time the consumption of water has been reduced to such an extent that it is now actually less than in 1879, and comparatively less than in 1875. The waste has been curtailed fifty per cent., the saving in fuel amounting in one year to $17,000.00, and, besides, securing a reserve pumping power of 20 million capacity from the old pumping resources.

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration. Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

Book Department.

The Business Manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of Books treating on subjects in which the readers of that journal have a special interest. Orders for Books are therefore solicited. Arrangements are being perfected to supply foreign scientific books promptly.

A line of Books on the following subjects kept in stock: Sanitary Engineering, Architecture, Construction, Engineering, Gas Manufacture, Electric Lighting, Sewage Disposal, Drainage, Plumbing, Food Adulteration and Hygiene. Lists sent on application.

BALDWIN, WM. J., STEAM HEATING FOR BUILDINGS. Or, Hints to Steam Fitters. Being a description of Steam Heating Apparatus for Warming and Ventilating Private Houses and Large Buildings, with Remarks on Steam, Water and Air in Relations to their Heating. To which are added useful miscellaneous tables. Third edition. With many illustrative plates. 12mo, cloth, $2 50

DREDGE, JAS. ELECTRIC ILLUMINATION. General Principles, Current, Generators, Conductors, Carbons, and Lamps. By Conrad W. Cooke, M. F. O'Reilly, James Dredge, S. P. Thompson and H. Vivarez. Chiefly compiled from Engineering, edited by Jas. Dredge; with abstracts of the specifications deposited at the Patent Office between 1837 and 1872 having reference to Electric Lighting, prepared by Mr. W. Lloyd Wise. About 600 pages text, nearly 800 illustrations...4to, cloth, $7 50

LOCK, WIGNER & HARLAND. SUGAR GROWING AND REFINING. A Comprehensive Treatise on the Culture of Sugar-Yielding Plants, and the Manufacture, Refining, and Analysis of Cane, Beet, Maple, Melon, Milk, Palm, Sorghum, and Starch Sugars; with copious Statistics of their Production and Commerce and a chapter on the Distillation of Rum. By Charles G. Warnford Lock, F.L.S., Editor of Spons' Encyclopædia of Manufacturers and Raw Commercial Products, and G. W. Wigner & R. H. Harland, FF.C.S., FF.I.C., Public Analysts, etc. Illustrated by 10 plates and 205 Engravings.....Demy 8vo, cloth, $12 00

BENJAMIN, PARK. WRINKLES AND RECIPES. Compiled from the *Scientific American*. A collection of practical suggestions, processes and directions, for the Mechanic, Engineer, Farmer and Housekeeper. With a Color Tempering Scale, and numerous wood engravings. Revised by Prof. Thurston and Vander Weyde, and Engineers Buel and Rose. 12mo, cloth, $ 2 00

DU BOIS, A. J. THEORY OF STEAM ENGINE. Translated from the fourth edition of Weisbach's Mechanics, containing notes giving practical examples of Stationary, Marine, and Locomotive Engines, showing American practice. By R. H. Buel. Numerous illustrations..... 8vo, cloth, $5 00

DU BOIS, A. J. THERMO-DYNAMICS, THE PRINCIPLES OF. With Special Applications to Hot-Air Gas and Steam Engines. By Robert Röntgen; with additions from Profs. Verdet, Zeuner, and Pernolet. Translated, revised, and enlarged by Prof. A. Jay Du Bois, of Sheffield Scientific School. 670 pages, 8vo, cloth, $5 00

HATFIELD, R. G. THE AMERICAN HOUSE CARPENTER. A Treatise on the Art of Building, comprising Styles of Architecture, Strength of Materials, and the Theory and Practice of the Construction of Floors, Framed Girders, Roof Trusses, Rolled Iron Beams, Tubular Iron Girders, Cast Iron Girders, Stairs, Doors, Windows, Mouldings, and Cornices, together with a Compend of Mathematics. A Manual for the Practical use of Architects, Carpenters, and Stair Builders. Re-written and enlarged. Numerous fine wood engravings. (1882).....8vo, cloth, $5 00

HATFIELD, R. G. THE THEORY OF TRANSVERSE STRAINS, and its Application to the Construction of Buildings, including a full discussion of the Theory and Construction of Floor Beams, Girders, Headers, Carriage Beams, Bridging, Rolled Iron Beams, Tubular Iron Girders, Cast Iron Girders, Framed Girders and Roof Trusses, with Tables calculated expressly for the work, etc., etc. By R. G. Hatfield Architect. Fully illustrated. Second edition with additions. (1880) 8vo, cloth, $5 00

NOTICE.

Bound Volumes

OF

The Sanitary Engineer.

The number of the first and second volumes of THE SANITARY ENGINEER is so limited that quotations for them are hereby withdrawn.

Prices will be given on application.

VOLUME III.—Bound in cloth, with Index, issues from Dec. 1, 1879, to and including Nov. 15, 1880, - - - $10.00

VOLUME IV.—Bound in cloth, with Index, issues from Dec. 1, 1880, to and including Nov. 15, 1881, - - - $7.00

VOLUME V.—Bound in cloth, with Index, issues from Dec. 1, 1881, to and including May 25, 1882, - - - $4.00

VOLUME VI.—Bound in cloth, with Index, issues from June 1, 1882, to and including Nov. 30, 1882, - - - $3.0

☞ *Sent by Mail. Postage 40 cents.* ☜

They can be supplied in London, by our Agents, Messrs. E. & F. N. Spon, 16 Charing Cross.

The following back numbers of THE SANITARY ENGINEER are worth preserving, and will be sold at prices quoted until further notice:

February, 1878..... 50 cents.

Contains an article on "Plumbers' Profits." Useful when a plumber's bill is disputed, as showing what percentage of profit is necessary and legitimate.

April, May, June, July..... } for the set $1.00
and October, 1878..... } or 20 cents each.

These issues contain articles from E. S. Philbrick, C.E., on "The Ventilation of the Public Sewers;" Robert Briggs, C.E., on "Heating and Ventilation," and Col. Geo. E. Waring, Jr., on the "Sanitary Aspects of Plumbing."

December, 1878, and January, 1879.....each 30 cents.

Article on the Electric Light, by Prof. Henry Morton, President of Stevens' Institute of Technology, "Terms of the Competition for Improved Tenement Houses." Articles on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., "Ventilation of the Capital at Washington," by Robt. Briggs, C.E. "Sanitary Condition of Tenement Houses," and Irvington Sanitary Survey," by Col. G. E. Waring, Jr.

March, 1879.....$1.00

Contains "Prize Plans in Tenement House Competition," with report of Committee of Award; a history of the movement which led to the passage of the Tenement House Act in New York.

March, April, May, June 1 and 15, and July 1, 1879, only a few left.....for the set $4.00

This series contains the ten selected plans on the "Model Tenement House Competition."

May, 1879.....50 cents

Has article on the "Holly System of Steam Heating," by Robt. Briggs, C.E. Article on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., and seventh and eighth "Prize Plan in Tenement House Competition."

August 1, 1879.....30 cents

"Plan and Description of a Model Paris Apartment House," by Lewis W. Leeds. Article No. 3 on "Domestic Sanitation," by E. S. Philbrick, C.E.

September 1 and 15, October 15, November 1 and 15, 1879.....each 30 cents

In this series is an illustrated description of the "Heating and Ventilation of the Utica Insane Asylum;" article on "Food Adulteration Abroad," by Prof. Henry Morton; "Domestic Sanitation," by E. S. Philbrick, C.E. Articles on "Water Gas—Its History and Manufacture," by Prof. Henry Morton, Ph.D. "Sanitary School Construction," by Dr. D. F. Lincoln; an opinion on the "Validity of the McCloskey Patent," by J. N. McIntire, Patent expert.

March 1 and 15, April 15, 1880.....each 50 cents

Valuable, as they contain results of "Model School House Competition," with report of the Committee of Award, and eight of the Prize Plans.

May 1 and 15, 1880.....each 50 cents

Very valuable for reference, as they contain full report (illustrated) of Dr. Carmichael, of Glasgow, on his experiments to test the liability of sewer gas and disease germs to pass through a water seal trap. Often referred to.

October 15 and November 1, 1880.....each 50 cents

An account of the "Heating and Ventilating Arrangements of the Madison Square Theatre;" "How to Utilize Exhaust Steam to Heat a Factory" (Illustrated). "English Adulteration Acts," by G. W. Wigner, F.C.S. An illustrated description of the Sewerage of Memphis.

December 1, 1880.....50 cents

Contains report of the Committee of Award in the "Food Adulteration Competition;" an article on "Recent History of Electric Lighting," by Prof. Henry Morton. A review of schemes for the sewerage of Newport, R. I, "Arsenical Wall Paper," by Dr. E. S. Wood, of Harvard Medical College.

May 15, 1881.....50 cents

A Review of Prof. Pumpelly's report on the filtering capacity of soil; an article on the "Safety of Theatres," by Jas. Harrison, Superintendent of the Board of Fire Underwriters, N. Y. A plan for removing ground water from a city house to the sewer (illustrated). A sectional plan of fitting up a Double Hot Water Boiler, as done in New York.

August 1 and 15, and September 1, 1881.....each 25 cents

Contains letters and articles giving full account of the system of Disposing of Refuse and Sewage at Birmingham, England.

October 1 and 15, and November 1 and 15, 1881.....each 25 cents

Review of Col. Waring's article in *Scribner's* on the "Drainage of New York." Article No. 1 on the system of "Water Waste-Prevention in Liverpool." Plan and description of a Sewer Weir and Geometrical Stair Case, designed by Sir Jos. Bazalgette, London; the Municipal Chemical Laboratory of Paris, by Dr. De Pietra Santa.

IN STONEWARE AND IRON.

Simple in construction. No Valves to get out of order. Automatic in action. Cheapest and best ever introduced. One placed as an INTERCEPTOR between house and street sewer, or Cesspool, will positively exclude foul air from any house. *WE GUARANTEE THIS.*

Price Lists and Testimonials mailed by STEWART & CO., MANHATTAN POTTERY, foot of West 18th & 19th Streets, and 312 Pearl Street, cor. Peck Slip, New York.

RECENTLY PUT INTO THE **WHITE HOUSE** BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP FOR Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 Superior Street,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL S TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

STEBBINS & BRIGHTWOOD
PLUMBERS' BRASS WORK.
BRIGHTWOOD, MASS.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

CREQUE'S PATENT
New Circulation
RANGE BOILERS

13 different styles—adapted and warranted for every possible situation.

ESSENTIAL FEATURES.

1st. Cold water is introduced at the bottom of the boiler, while hot water is injected into the top of the boiler.

2d. By this system the chilling of the hot water in its passage to the top of the boiler is avoided.

3d. Hot water being stored at the top of the boiler without chilling, it can be used immediately; thus making the boiler serviceable as soon as the water-back is heated.

4th. The circulation is positive in direction and rapid in action, and heats in very much less time.

5th. Circulation being positive, there is no cracking, snapping or rumbling in the boiler.

6th. There being no reversal of circulation, there is no sudden expansion and contraction of the boiler shell. The boiler will therefore wear longer.

7th. In case of a part of the boiler being filled with steam, a sudden injection of cold water does not condense it, as the injection is at the *bottom* of the boiler, thus forcing the heated water above it to fill the space left by escaping steam, when a hot water cock is opened.

8th. A considerable saving in material and labor in cost of setting up the boiler and connecting pipes.

9th. In consequence of a rapid, invariable and constant circulation, much more hot water can be obtained from a small sized boiler than from a much larger boiler of the old method of circulation. These boilers are arranged to meet every conceivable requirement of location or condition. To both the plumber and architect this is a great advantage, while it also lessens the cost to the builder.

N. B.—Please send for Catalogue fully explaining the various situations for which these boilers are intended.

A MODEL SLOP SINK,

IN ONE PIECE OF EARTHENWARE.

When set on and surrounded by White Glazed Tile, as shown, it makes the cleanest and most useful Slop Sink arrangement we know of.

It is provided with a Flushing Rim similar to the Hellyer Hoppers.

It is sold with the Flushing and Water Supply apparatus, that is made of Brass Pipe, as illustrated, or with a set of Combination Cocks to attach to Lead or Iron Pipes that may be concealed behind the wall.

It is arranged so that no overflow can take place when a pail may be set over the outlet hole and the water carelessly left running.

Persons wanting some such thing will find it worth while to take the trouble to call at our warerooms and examine it.

The apparatus complete, as shown, we designate as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 40.

When the Combination Cocks and the Hoppers only are wanted, it is designated as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 41.

We have fitted up Show-rooms at No. 1 Pemberton Square, Boston, where our specialties can be seen. Persons living in Boston and vicinity are invited to call and examine them.

We have fitted up in our warerooms the various styles of Water Closet Apparatus that are to be taxed in this city $2.00, $5.00, $10.00 and $20.00 per year respectively. Architects, Plumbers, and Householders who may be interested, can there see which arrangement is best suited for their particular needs.

NOTICE.—Correspondents will prevent needless delays and annoyance if they will address all communications, except those of a strictly private nature, to THE SANITARY ENGINEER. Checks should also be drawn to the same order.

POPULAR OPINION ABOUT SANITARY IMPROVEMENT.

We have printed at length on another page a communication from a Cincinnati correspondent, because it is a very good summary of the arguments used by the average alderman and ward politician against sanitary improvements or regulations. The scientific explanation or confutation which our correspondent calls for cannot, however, be made short, simple and universally comprehensible as he seems to suppose. Were this possible everybody would be scientific. Science is organized common sense, and in most cases it has to deal with probabilities, not certainties. A really scientific man freely admits almost all the statements made in this letter. Filth does not always produce disease, and when filth diseases are prevalent they do not attack all persons. There is no evidence that scarlet fever, or small-pox, or measles, or whooping cough are caused by filth. Those who urge sewerage, and common cleanliness on the ground that they will prevent these diseases, have either not studied the subject, or take the ground that it is justifiable to frighten people into good behavior by threatening imaginary dangers. This we do not believe. There is abundance of evidence that good sewers in a city diminish disease and mortality, that diphtheria, typhoid fever, diarrhœal diseases, some forms of lung, throat, and skin disease, etc., are connected with the presence of excreta and decaying organic matter in the air and water, and this evidence is contained in hundreds of volumes in which are recorded the experience of different cities and countries. It is the same kind of evidence which leads a prudent man to insure his house and his stock of goods. The facts that he has never lost anything by fire, that there has never been a fire in his block, etc., etc., do not influence him in the least.

That pseudo scientists are much more positive and dogmatic in their assertions about the causes of disease and the best means of prevention than the really well-informed scientific man is true. It is also true that it would be a good thing if the public could distinguish between the true expert and the pretender, but this is often impossible. Sooner or later it is true that the sanitary quack, like most other quacks, finds his true level, and that all his declamations, and public tions and reported interviews in newspapers fail to inspire confidence or to keep him in office—but for awhile he flourishes and makes it pay.

Yet those who really, honestly, wish to know where they can get reliable information with regard to the effects of sewerage, or the merits of different systems of drainage or water supply will not find it difficult to obtain it. We all know a few, a very few, men whom we consult with a reasonable certainty that they can either answer our questions or tell us who can, and most important of all, will honestly tell us that they do not know, when such is the case. We believe that the sanitary interests of Cincinnati are just at present in a bad way, and that there is a very considerable danger that it will become an unhealthy city, and suffer serious loss in its business interests.

It is in danger from an impure water supply, from defective sewerage, from a large amount of stored filth in privy vaults and cesspools and from its slaughter houses.

None of these things, nor all of them, may produce an epidemic; the probabilities of such a result are, however, at least ten times greater than those of fire on Fourth street, and there are few business men on that street who do not think it wise to insure.

It may be said in reply that sanitary precautions do not insure against an epidemic. True, but they go a long way towards doing so, and they certainly promote health, comfort and morality. Cincinnati should have expert advice upon her system of sewers and water supply. She should have a sanitary association, composed of the leading business men and most intelligent citizens of the community, and this associa- should employ a commission of three of the best engineers in this country to tell them what ought to be done. When they know this, they can then exert their influence to some good purpose. Without this, all effort is wasted, because uncombined and purposeless.

A decision which will have a most wholesome effect was given in the Court of General Sessions last Friday when John F. Crotty, of No. 232 East One Hundred and Twenty-first street, was fined $50 for violation of the plumbing law in his work on five houses on Alexander avenue. We have already exposed the character of this job. It now appears that after the specification had been approved by the Board of Health, Crotty, as he claims on the instigation of the owner, who seems to have appeared under an assumed name, paid no attention to the specification, but constructed the work in the shameful manner we have noticed. Crotty's punishment appears small for his offense; it was mitigated because he had shown a disposition after the work had been detected and condemned to do all he could to put it in proper condition. Moreover, Justice Bixby's remarks will effectually prevent any who may be inclined to imitate Crotty from expecting to escape with an equally light penalty. The

Digitized by Google

Justice said he had made up his mind to send Crotty to the penitentiary and inflict the full penalty of the law, but in view of the mitigating circumstances he should only fine him fifty dollars, and he gave warning to others not to expect similiar leniency hereafter.

This prosecution has already done more to convince the skin plumbers that the Board of Health are in earnest than all that has heretofore been done. As a result of it, several men whose work has not been what it should be have set to work to remedy their violations of the law.

We last week printed the ordinance passed by the Board of Aldermen of the City of Boston, providing for the registering of plumbers and supervision of plumbing. It is exceedingly gratifying that this movement should have been instituted and carried through by the leading plumbers of that city. If they look after the enforcement of the law, the public and the craft will be greatly benefited thereby.

Since writing the preceding, we learn that in the new code adopted in the closing hours of the session, there was a clause repealing all ordinances not therein included, and, by an oversight, the plumbing ordinance had not been enumerated. We trust the matter will soon be righted.

The State Board of Health, of Louisiana has formally declared the Auxiliary Sanitary Association of that city to be meddlesome and useless, claiming that "instead of remaining auxiliary, it has striven to become supersidiary," and that it has especially sinned in approving "the useless, Congressionally-condemned and moribund National Board of Health."

As the Auxiliary Sanitary Association is composed of some of the most prominent and influential citizens of New Orleans, who are wise enough to see that the commercial interests of the city, which are their own, depend largely upon its healthfulness and good repute, and have striven to secure this, it seems probable that this defiant action of the politicians of the Board of Health will produce their downfall, a result which will afford very general satisfaction.

At the Theatre Royal, Brighton, England, the whole staff is instructed in the fire drill which is practiced after every evening's performance. Even the manager takes his part in it, coming to the front of the curtain and announcing that an accident has occurred and exhorting the supposed audience to go out quietly, while the rest of the staff are at their stations with the hose, hand pumps, and other apparatus which is provided. An eye witness of this drill, Capt. Shaw, of the London Fire Brigade, states that the drill was carried out in workmanlike manner, quickly and without confusion, and that in a few seconds all the fire extinguishing appliances were in readiness. At the same time attendants threw open all the doors and the audience would have had free egress from the house.

There were 6,600 water meters in use in New York City on September 30, or about 7 per cent. of the number of services. The Commissioner of Public Works reports that 1,579 inspections were made, and 143 cases of waste at night were discovered in the quarter ending September 30. This is a small proportion of the 100,000 connections in the city, and it shows that the number of inspections must have been very limited. The *City Record* recently chronicled the discharge of a number of waste inspectors. It is generally the case that when appropriations run short, employés who might be of some use are selected for removal for economy's sake.

The Bowling Green Building Company of this city, filed a certificate of incorporation, the 27 ult.; object, the erection of buildings in this city; capital $1,000,000.

SANITARY ARRANGEMENTS IN THE RESIDENCE OF MR. CORNELIUS VANDERBILT.

(Continued from Page 75.)

VI.—The Drainage System and its Ventilation.

Here, as in his work in the residence of Mr. William H. Vanderbilt, Mr. Ennever has departed from the ordinary method of ventilating the drainage system. This, however, is not so bold a departure from the common method as was that. There, it will be remembered, traps were omitted from the main house drains and from water closets, but each soil pipe was trapped at its foot and a ventilating pipe taken from either side of this trap, serving to ventilate the whole system, even to the street sewer. (See The Sanitary Engineer of April 27, 1882, Vol. V., page 460.) Here there are the usual traps on the main drains but the fresh air inlets now required by the Board of Health are omitted, this work having been commenced before the plumbing law took effect. In place of them the soilpipes are designed to serve as fresh air inlets, by connecting them at the bottom with a heated chimney flue. The air pipes from the traps of all fixtures in the cellar, basement and first floor (except the line of slop sinks, which are all connected with the same air pipe, extending from the lowest trap to above the roof) are connected with the same hot air flue instead of being carried up through the roof in iron pipes, as is customary, and the rain leaders are also connected to this flue from below the traps near their lower ends.

This is all shown in the accompanying drawing, which for the most part represents what appears in the servants' bath room in the cellar. For the sake of grouping the whole arrangement into one drawing, the chimney flue and the connection of the main horizontal pipe with it is brought in from beyond the limits of the sketch as also the soil pipe and its connection with the horizontal air pipe which is generally not so short and direct as shown.

There are two main air pipes nearly horizontal, like that shown in the drawing, one on each side of the house near the outside walls, having connection with all the soil pipes, rain-leaders and traps of fixtures below the second floor. The two mains are united near the branch connecting with the chimney flue, by a full-sized pipe running along under the basement floor from one side of the house to the other. The connections between these main lines and the traps of fixtures are often made very circuitous, in order to get around partition walls in the cellar or have the pipes out of the way; and the vents for the traps throughout the house are, most of them, taken, not from the crown of the trap, but generally from six to ten inches below that point.

Another interesting feature shown in the drawing is the connection between the water closet waste and the rain leader. The water closets are of the plunger type, but without the trap which sometimes forms a part of the closet; in place of it is an arm or offset which requires a vent at its end to allow the escape of air when the plunger is lifted. In the cellar and basement and on the first floor these vents are taken to rain leaders above the traps, as shown in the drawing. The connections are of galvanized iron except a short piece of lead at the foot. From the closets above the first floor separate air pipes are carried up through the roof instead of connecting them with rain leaders.

The reason of the indirect connection of the bath waste with the drain is that the bath was not at first intended and the brick and cement floor had been laid (from the left) up to the point where the waste pipe goes down, where the flooring had been interrupted by temporary closets for workmen.

The cellar floor consists of bricks set on edge in Portland cement, on two layers of asphalt (each about ⅜-inch thick), which covers a bed of concrete (consisting of two parts of sand to one of Portland cement) four inches thick. The drains are deeper than this for a considerable portion of their extent, and there they rest on the earth or rock bed in the special excavation made for them.

There are two connections with the public sewers, one with that in Fifth avenue and the other with that in 57th street, under the lawn which runs back to that street and the two are united under the house. Each is of iron, eight inches in diameter; inside the house they are reduced to 7-inch, 6-inch and 5-inch. The traps on them are just outside the house under the flagged area. Brick man-holes with iron covers give access to them. Just inside the traps the drains have connections with the area cesspools, all of which are trapped, some by masons' or cesspool traps, and others by turning down the outlet pipe.

The drains in the cellar above the floor and the horizontal air pipes are generally supported on brick piers to a height of from two to three feet, and above that height, are supported on the walls by iron brackets or from the ceiling by hangers. The soil pipes are mostly in brick recesses in the walls, some of which are accessible and some not accessible. The ordinary air pipes are, as a rule, one inch smaller than the accompanying soil or waste pipes. Above the first story they are taken up through the roof independently, in the usual manner, while those below the second story, as before stated, are connected with the heated flue. The ends of the pipes above the roof are protected by ventilating caps.

The refrigerator wastes are through 2-inch wrought iron pipes entering a cast iron cesspool

Digitized by Google

about 14 inches by 18 inches in the cellar bottom. That from the large refrigerator in the cellar passes down to the bottom of the cesspool and turns up several inches. That from the refrigerator up stairs receives the waste from a fountain and has a deep (8-inch) trap on it before entering the cesspool, into which it dips several inches. The outlet to the drain is through a 3-inch pipe, which dips nearly to the bottom of the cesspool. An iron cover in the top gives access to it for removing deposits.

The present article concludes the description of the plumbing in this house.

A CASE OF VERY BAD PLUMBING.

To the Editor of THE SANITARY ENGINEER:

The following case of dangerous plumbing came to my notice to-day and I send you the particulars, knowing that you have taken up the exposure of such work in the city.

Some time since the Board of Health was called upon to examine the premises No. 310 West 36th street, an English basement house about 12 feet wide, evidently built for a private residence, but now sub-let by the lesee to several families, making it a tenement. An order was made on the owner, E. Crawford, of 220 West 28th street, to carry the soil-pipe above the roof. Not feeling satisfied with the work done under the order, the inspector asked me to look at the case with him, and together we made a thorough examination—tearing up woodwork, etc., and found enough to convince us that the complaints of bad smells, headaches, etc., were well founded.

By referring to the accompanying sketch, you will see that the soil-pipe is ventilated by a two-inch iron pipe. This was the so-called compliance with the order. The work was said to have been done by the owner himself, who, it is reported, never employs a mechanic, as he says he is an engineer and knows as much about plumbing as any plumber, and this is the way he did the work: The cover of the light-shaft which leads from the bath-room was taken off; the two-inch ventilating-pipe was put together in lengths, run up the shaft, and then, with a couple of bends brought to the trap of the water-closet. A hole was dug in the crown of the trap, the end of the pipe set over it and everything made tight (?) with some putty and a rag. The end of the bath-waste is set over a hole knocked in the soil-pipe and secured with putty. The plugs *a a*, etc., of the soil-pipe are of cement, and cracked where the waste-pipes join, so that a knife can be inserted between the pipe and cement. Being unable to tear up the basement floor, we tried the pepperment-test on the house-drain and found it even more defective than the upper part of the work. An order, covering these defects, will be made on Mr. Crawford.

Yours truly,

FREDERICK W. OWEN.

TYPHOID FEVER AND LEMONADE.

During the ten weeks, ending September 23, last, a sudden and considerable epidemic of enteric fever affected the urban and portions of the rural districts of Evesham. The total number of attacks in the former district were 48, and in the latter district 21. At first sight the patients appeared to have nothing in common which could account for the disease. The houses in which they lived were in many instances several miles apart, the sanitary circumstances of the dwellings varied widely, sewers and water supply were entirely different, and the milk supply was derived from several independent sources. It was, however, elicited that one and all of the patients attacked before August 8, whether residing in the town or in the country, had attended Evesham regatta, and that they had all been present in one special meadow. The circumstances of this meadow had to be very carefully considered, because it was the locality in which two sewer ventilators were placed, and near which were sewage settling tanks. But for reasons given, these conditions could not be identified with the epidemic, and a fresh cause had to be sought. It was then ascertained that of the 46 persons upon whom the "regatta influence" could have operated, 32 had certainly, and 11 had most probably, taken water in the form of lemonade, or to a less extent in the form of ices, or again, as an admixture with spirits, at a certain refreshment stall; and even as regards the three remaining patients it could not be said positively that they had not partaken of one or the other of the articles in question. The water, which had certainly been used for some, and which had probably been resorted to in the case of all, of the refreshments, was procured from a well which was situate near the meadow, and which was found to be so seriously contaminated that it was at once closed under the magisterial order. As confirmatory of the view that the refreshments and the disease were related to each other as cause and effect, Mr. Fosbroke, the Medical Officer of Health, cites some interesting details. Thus, a party of three persons repaired to the meadow in question on the regatta day; two of them partook of lemonade and subsequently developed unmistakable symptoms of enteric fever; the third took no such refreshments and altogether escaped. The only point in Mr. Fosbroke's reasoning which appears to be at all inconclusive is the circumstance that in order to associate some of the attacks with the polluted water used in the preparation of the refreshments on the regatta day, it becomes necessary to admit a longer period of incubation than is usually met with in the case of enteric fever. Still, 27 cases were recognized within 19 days of the date of the regatta, and though some appeared to be developed after an even longer interval, yet it is quite possible that this may have been due rather to a difficulty in determining the exact nature of the early symptoms, than to the existence of a prolonged incubation period.—*Lancet.*

MODERN SANITARY LEGISLATION.

The *Builder* publishes an abstract of an address by Prof. Reklam, of Leipsic, at the Brunswick Hygienic Congress, in which he makes a comparison between the legislative measures adopted by the leading nations for the advancement of their sanitary condition. The system of hygienic legislation of France is fairly well planned but inefficiently carried out. Much the same state of things exist in Italy and Spain, though in the latter country the medical boards are doing good service at present. The position of sanitary matters in Belgium exhibits a kind of compromise between the systems in operation in France and Germany. The *Conseil Central de Salubrité publique* is the leading sanitary authority, and although not in a position to enforce its recommendations, they are voluntarily submitted to by nearly all the local authorities of the country. In Holland each district has its sanitary council, but there is likewise in each case an inspector appointed by the Government, who acts as an intermediary between the local and national authorities.

He attributed the increased attention given during the last forty years to sanitary matters in England to the cholera epidemics. In Germany progress had been slower, but now an efficient system is provided by the Imperial Sanitary Administration, with its various local organizations. In some States the local medical bodies elect members to the Boards representing groups of districts, and these Boards send deputies to the head administration. In other States comparatively little progress has been made, on account of the apathy of those concerned, and Prussia is, more than any other State, open to such a charge, sanitary legislation being there in a backward condition.

In Switzerland there has been by popular desire an abrogation of some laws affecting sanitary matters.

The speaker considered that the fault of all modern hygienic legislation consists in the fact of its having been in most cases enacted at different times, and thus not forming a harmonious whole. Two sanitary codes have come into force, however, within the last year, which he quoted as models of what legislative enactments of this kind ought to be. In Finland, Prof. Hjelt has devised a law which meets all the requisite emergencies. In every town there is to be a sanitary commission, which consists of the chief of the police, the municipal architect, the local medical officer, and three town councillors. The whole *surveillance* of sanitary matters is in their hands. This law deals with town and country hygienic measures in a uniform manner and provides for children's playgrounds in every town.

The regulations now in force in Servia place the authorities of that country, according to Prof. Reklam's view, in the front rank of sanitary reformers, Servia being the only European country which has an independent sanitary budget. Its hygienic code has been elaborated by Dr. Gjoryjorics, and although only introduced last year, is now in practical operation. There is an annual revenue of nearly 50,000*l.* devoted to sanitary measures.

CINCINNATI SEWERAGE.

UNSCIENTIFIC OPINION AS AN OBSTACLE IN THE WAY OF IMPROVEMENT.

[From our Special Correspondent.]

Whether thorough sanitary provision in any city can be made against the ravages of disease depends upon the prevailing sentiment of the unscientific citizens, since those permanent provisions, such as sewerage, healthful water supply, and the like can be only effected with their consent expressed in municipal legislation, and even sanitary police regulations, provided for by statutory law, cannot be efficiently enforced against their opposition. This opposition has been expressed in every direction in Cincinnati, and is in no small measure due to want of confidence on the part of the unscientific public in the opinions of those quasi-scientists usually at the head of sanitary affairs in cities, and in the opinion of the ordinary physician, who knows and cares less about the origin than the cure of disease. The thought has impressed itself upon the mind of the writer that there could not be a better thing written in the interest of the general public than a scientific explanation or confutation of the unscientific man's alleged facts, and his opinions founded upon them. It would be certainly far more potent in securing the adoption of sanitary appliances and in enforcing sanitary regulations than the nice questions that scientists delight to make issues of between themselves. In the very heart of Cincinnati, westward and south to the river, is a large and populous district, containing, perhaps, one-fourth of her population, without any sewerage. Over ten years ago there was introduced into council a sewerage ordinance to supply this district with sewers at the cost, of course, of the abutting property holders. The people at once announced their unscientific theories and made war upon the ordinance. They declared that the sewers are not a necessity, and pointed to the comparative healthfulness of the residents during both healthful seasons and seasons of plague. They alleged that such is the character of the deep soil underlying the bottom portion of the city that the contaminated fluids from vaults and surface drains are absorbed by it, and that if they contain the germs of typhoid and a thousand other diseases, the heroic soil smothers the life out of them and prevents the accomplishment of their malignant work. A month or two ago, however, after a ten years' war, on considerations of personal comfort mainly, the ordinance was passed against the protests of the representatives of the district. It is yet doubtful if the work will be done. Nearly all the upland suburban districts of the city are also without sewers. Every heavy rain fills up their vaults, and if they can secure no under drainage, their cellars also, while the health board have declared overflow pipes into open gutters nuisances All the hill people believe in the germ theory, and have been looking forward to the coming pestilence. Eastern hill-top sewerage, however, is a costly undertaking, since it must have its outlet in the river west of the water works. The property owners cannot stand the expense of the main sewers, and consequently they have made common cause, and prepared a bill, providing for an addition of one mill to the tax levy to be devoted to the building of main sewers in the city. An effort will be made to have it passed by the Legislature this winter. Against this, however, the unscientific districts, and those already sewered, are expected to "kick" and its passage is perhaps doubtful. It will be perceived, therefore, that among the masses there is no dread of disease from want of sanitary appliances that will weigh against the fear of being taxed to construct them. The same is true in regard to the enforcement of sanitary regulations. Vaults are permitted to stand full, decayed vegetable matter is permitted to litter the yards and gutters, and catch basins are made the receptacles of animal offal, because quasi-scientific opinion has no weight with the masses. For these reasons and that they may be confuted the writer presents the arguments of the average unscientific man who is impressed with a conviction that there are factors in the conditions producing diseases which are both unknown and overlooked, and which perchance are not always found, and do not necessarily exist in drain, cesspool or sewer, or in the gases which they exhale. For example, just now there is typhoid and scarlet fever in Cincinnati, and it is not uncommon to hear physicians deprecate the bad sanitary conditions of this or that locality. Yet the sanitary conditions, say the unscientific men, are the same as they have existed, year after year, in those localities, when no such disease manifested. The conditions are no worse, in fact to all appearances the same as in ten thousand other places in the city where the diseases have not appeared. And not only in the cities, but the villages, and in the farm houses here and there on the hill side, and in the valley, all over the continent are to be found typhoid and scarlet fevers, where neither drains, nor sewers, nor cesspools, nor the noxious gases are supposed to exist. As with the diseases named, so with every other. Relying upon the assumption that like causes produce like effects, the unscientific man is apt to entertain a suspicion that much of the scientific theory about the origin of disease germs is claptrap. The unscientific man observes that in the vicinity of marshy streams and swamp lands malarial fevers prevail in the fall, to which some are susceptible and others not; that personal uncleanliness produces skin diseases in some, while others who are filthy from one year's end to another are entirely free from them; that time out of mind famine and pestilence have gone hand in hand; that poor food, little of it, irregular habits of drinking, eating and sleeping, artificial stimulation and exposure let in any and every disease upon the human organism, and that when epidemics prevail in populous cities where the conditions last enumerated obtain, as a result of protracted hard times, its ravages are fearful and greatest among the poor; but when the poor are well fed and clothed in good times, the unwelcome visitor does not nicely distinguish between the cleanly mansion and the filthy tenement, save that as the latter is more crowded it may find proportionably more victims. The unscientific man, therefore, has his doubts about a host of diseases lurking in closet pipes, surface drains, sewers, cesspools, and like receptacles of refuse; and in this homely way of arguing the matter will point you to the hosts of those, in a great city, who year after year stand at the beam in the tanneries over decomposing flesh, who follow the occupation of public scavengers, who descend into one catch basin after another, who as vault-cleaners spend half their waking hours in the midst of intolerable stench, and are nevertheless as healthful as other men. He has a general sort of a notion that whencesoever diseases spring they are generated over large districts in a mysterious manner and quite independent of the vaults, cesspools or sewers of large cities. Some are disposed to believe them the results of malign planetary influences; some regard them as special Providences in punishment of national sins from which we cannot escape, and others see in them the workings of a law of compensation and equilibrium that provides against over-population, and from which the human race cannot hope to escape. In fact the disposition of no small portion, were it not that cleanliness secures comfort, is to sit down in the midst of filth and take the chances.

[We print elsewhere a comment on this letter.]

Mr. Richard Prescott recently read a paper before the Troy Scientific Association, taking for his subject house drainage. A very full abstract of the paper is given in the Troy *Times* of Dec. 21, and we have been much pleased with it. The only exception which we take to Mr. Prescott's statements and advise relates to the following sentence. "Finally, we are prepared to say that in a house plumbed in accordance with the requirements of sanitary science, scarlet fever, typhoid, diphtheria, meningitis, etc., will not originate, while they are certainly invited by the absence of such precautions." It is not quite certain in what sense the word "originate" is used in this sentence. If it is meant in the sense of occur, the statement is certainly incorrect, for these diseases occur in the best arranged houses. If it is meant in the sense of spontaneous origin, *i. e.*, by the influence of filth alone, without germs from a preceding case, the statement is true but valueless, for these diseases do not occur spontaneously in any house. Good plumbing is a very good thing, it prevents a great deal of sickness, discomfort and death, but it is not an universal panacea. There are many ways in which germs of typhoid, scarlet fever and diphtheria gain entrance to a house besides the drain pipes, and as to meningitis, it has prevailed most fiercely in houses where there was no plumbing whatever.

We think Mr. Prescott is doing good in instructing the public as to the difference in good and bad work—and it is very possible that in the above sentence he has not been correctly quoted. We call attention to it simply because we are satisfied that some of the greatest obstacles to the progress of sanitary work are due to the fact that some of its advocates promise too much, and that the better plan is to rather under than overstate its advantages.

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.

E. G. LOVE, Ph.D., *Gas Examiner.*

GAS *Versus* ELECTRIC LIGHT IN DOWN-TOWN STORES.

To the Editor of THE SANITARY ENGINEER:

DEAR SIR:—Perhaps the following statement about the comparative cost of the Edison lamps and gas in a printing establishment (E. P. Coby & Co.) in this city, may be of interest just now, when the public is waiting, with some anxiety, the outcome of the effort to supplant gas by incandescent lamps in down-town stores.

In the establishment in question, the Edison lamps were put into the counting-room, first floor, on trial, to get a basis on which the cost could be afterward adjusted, and for this first month's trial the lights have been free. Within a few days, however, the company have sent out a statement of the amount of light given between certain dates, and the value of it on the basis on which hereafter they will charge their consumers, viz.: $1.00 per 1,000 candles, which, according to the company, is about equivalent to gas at the present rate, $2.25 per 1.000 cubic feet. This, however, does not seem to be the case, at least with this establishment, as the following facts will indicate.

There are seven of the Edison incandescent lamps in the counting-room, of the ordinary size in down-town stores, to replace five gas burners. Owing to defects in the carbons, which have usually left one of the lamps useless, it has been necessary to light one or sometimes two gas burners in addition to the electric lamps. Under these circumstances, a statement is rendered by the Edison company for the period from October 10 to November 13. Total amount of light furnished was 13,246 standard candles, for which, had the company charged their proposed price of $1 per 1,000 candles, the cost would have been $13.25. Messrs. E. P. Coby & Co. estimate that, taking both cloudy and fair weather together, the lamps have burned possibly five hours on an average daily. At about the same time this statement was received from the Edison company, the Mutual Gas Company rendered their bill for gas used in the press room and composing rooms. Connected with one meter are 25 6-foot burners on the two floors, and also the one or two which are used in the counting-room. Of this number 23 are regularly lit, including those in the counting-room, and burning on an average 1½ hours per day. The gas furnished by the Mutual Company, as appears from the weekly statement in THE SANITARY ENGINEER, has an illuminating power of 25 and upwards. The price of gas is $2 25 per 1,000 cubic feet and the bill for the burners enumerated, from October 23 to November 22, was $10.35, representing a consumption of 4,600 cubic feet of gas.

Now, assuming that six of the seven electric lamps were always in good order and lighted during the 5 hours per day when artificial light was necessary, the case would stand thus:

6 lamps, 5 hours each = 30 hours per day; 23 gas burners, 1½ hours each = 34½ hours per day.

Number of days from October 10 to Novembor 13, 34; total hours of electric lights for that period. 1,020.

Number of days from October 23 to November 22, 30; total hours, gas burners, for that period, 1,035.

Cost of 1,020 hours, electric lamps, $13.25; cost of 1,035 hours, gas burners, $10.35, or about 35 per cent. in favor of gas.

The hours in which the gas burners were lighted have, in the opinion of the gentlemen named, been rated low as compared with the hours during which the electric lamps burned, and in reality the facts would be rather more favorable for the gas.

As to the quality of the light furnished, it is the opinion of Messrs. E. P. Coby & Co. that the gas burners gave more light than do the lamps. An experiment made by

Digitized by Google

turning off one of the lamps at the rear of the office and turning on a gas burner, and then reversing the test, seemed to prove their opinion correct; certainly the gas light appeared to illuminate that part of the office better than did the lamp.

It is to be noticed, in conclusion, that this comparison is with gas at $2.25 per 1,000 cubic feet, a price which it is believed is much above what the gas companies are able to furnish gas at, if they choose to do so.

I have submitted these facts to you for your opinion, fully recognizing that the data given are quite few in number to base a general opinion as to the cost of electric lights and gas on. Still, as we have here, side by side, the bills of both the gas company and the electric light company for the same season of the year, each bill rendered without any thought that it would be used for comparison, the figures cited may be taken as a finger pointing to the real facts in the present dispute between gas and electricity. X.

[As our correspondent says, the data given are not very satisfactory for making comparisons. The rooms lighted are not the same, and there is nothing but guess work as to the comparative lighting effect produced by the two systems. It is stated, however, that in the opinion of the proprietors more light was furnished by the gas burners than by the electric lamps.

It would be a simple matter to connect the gas burners in the counting room with a separate meter, and when the burners were in use to so adjust them that the amount of light furnished should be approximately equal to that of the electric lamps. Some rough photometric observations might be made to aid in equalizing the light from the two systems.

A closer comparison might be made than the one to which our correspondent calls attention. Take the case of the counting-room, in which six incandescent lamps were employed. These lamps are usually rated at 16 candles each, at least this is the company's estimate of them. Then suppose these lamps are in use for five hours daily for twenty-nine days, as given in the company's statement, and we have 13,920 candles. The statement of the company gives 13,246 candles. The monthly bill for incandescent lighting would then be $13.92.

It is also stated that the lamps replaced five gas burners, but as it was necessary to light one burner in addition to the lamps, we can say that the six lamps replaced four gas burners. The burners are stated to be six foot burners, but as it is somewhat doubtful about the burners passing six feet per hour of the Mutual gas we can place them at five feet, and safely assume that the illuminating power is 25 candles. Then if the burners are in use five hours per day and for twenty-nine days, we shall have 14,500 candles.

The gas consumed in this time would be 2,900 cubic feet, and its cost $6.52, or about one-half that of the incandescent lamps. Whatever may be the other claims urged for the incandescent lamps it is clear that as regards cost, the gas burner is very much more economical. —ED. SANITARY ENGINEER.]

ELECTRIC LIGHT NOTES.

A London dentist uses a small incandescent carbon lamp to illuminate the cavity of the mouth during operations.

Two ships of the Union Steamship Company, of New Zealand, are to be lighted by the Edison incandescent lamps.

A premium of £500 has been offered by a Mr. Ellis Lever, says the *Review of Gas and Water Engineering*, for the invention of the best portable electric lamp for coal mines.

One hundred and forty applications for provisional orders under the new Parliamentary electric lighting bill were made to the board of trade up to Dec. 21. Twenty-four of them were made by the Metropolitan Brush Electric Light and Power Company. The Swan Company applied for four orders; the Pilsen-Joel for three; the Incandescent Electric Lighting Company for five; Ferranti, Thompson & Ince for two.

The Edison Electric Light Company is now lighting 225 houses in this city, wired for 5,000 lamps. The residence of J. Pierpont Morgan is lighted by an isolated plant of 269 A and 116 B lamps, arranged as follows: Main halls and stairway, 39; attic rooms and halls, 14; dome over stairway, 20; servants' halls and butler's pantry, closets, etc., 15; 3d floor bed-rooms and dressing-rooms, 20; 2d floor bed-rooms and dressing-rooms, 40; 1st floor—drawing room, 42; reception room, 11; library, 10; sitting-room, 22; dining-room, 22; stained glass skylight in dining-room ceiling, 22; conservatory, 42; basement, 28; cellar, 28; stable and carriage house, 6; engine-room, 4

Professor Silvanus Thompson has been investigating the origin of the electric light. Davy is supposed to have discovered it either in 1809 or 1813; but it appears Messrs. Caballo and Cuthbertson gave an account of the carbon arc in 1806. There is a published notice of some experiments of Sir Humphrey Davy in the *Philosophical Magazine* for 1804; and in a French journal of 1802 there is an announcement concerning the display of a light from carbon pencils, by a M. Etienne Gaspard Robertson. The light in the latter case was procured by means of a large pile. It is impossible, at this time, to say whether Davy or Robertson was the first to discover the electric arc. Professor Thompson believes, however, that there is an entry in a laboratory note book at the Royal Institution which seems to show that Davy discovered it in 1802. In any case, the electric arc light is quite 80 years old; and it may have been noticed independently by several persons, since it must have been manifested in the course of the simplest experimental handling of a large pile. Up to the present time invention has been exhausted in endeavors to embody this very simple discovery in practicable shape.—*Review of Gas and Water Engineering.*

Seven electric light companies applied for the lighting of Chelsea Vestry, London. To guide them in their decision, the vestry addressed a list of questions to the companies and also to Siemens' Brothers. The Brush company proposed to replace 1,250 street gas lamps with 400 arc lights of 2,000 nominal candle-power each, for which the first annual cost would be £10,000 or $50,000. For other purposes than street lighting, they would supply Lane-Fox lamps of 10 to 100 candle-power, at 6*d.* per 1,000 erg hours. The Edison Company gave no definite reply. It would employ only incandescent lamps, but although it is now lighting the Holborn viaduct at the price of gas, that contract could not be made a precedent. The Jablochkoff Company estimated 1½*d.* per lamp per hour as the probable cost to the vestry. The Swan Company would take gas as the basis and supply an equal amount of light for the same price, stating that this would leave no margin of profit until improvements are made in the production of the current. The Ferranti Company would work a station at a price which would furnish a dividend of 10 per cent. on the capital—about twice the cost of gas for three times the amount of light. The Pilsen-Joel Company gave no estimate of cost, and Messrs. Siemens' Bros. & Co. made no direct reply, referring the vestry to Dr. Siemens' address.

Meter-ites.

The United States Equitable Gas Company, of this city, was incorporated the 28th ult., capital, $2,000,000.

Judge Arnoux has dissolved the injunction obtained by one Michael Noonan, restraining the mayor from granting permission to the Equitable Gas Company to lay pipes in the streets of this city.

Mr. Edward Stern, the original promoter of the Municipal Gas Light Company, of this city, and more recently the organizer of the new Equitable Company, died on Jan. 1st, at the Hoffman House.

Whether from threatened competition with electric light companies, from public dissatisfaction with existing prices or from whatsoever reason, the Hartford, Ct., Gas Company have voted to reduce the price to private consumers from $2 to $1 90 per 1,000 cubic feet, the reduction to date back from December 1. After the first of January the price to the city will be $1.80 instead of $1.90 as at present.

The Paris Gas Company are laying a new main, one metre in diameter, the material being bitumenized cast iron. The pipes, says the *Journal of Gas Lighting*, are laid in a bed of hot bitumen mixed with fine gravel. This composition is said to acquire great strength and consistency in cooling, and to protect the sheet iron so well that it does not deteriorate or oxidize except in a soil saturated with damp.

A petroleum engine constructed in Hanover has been experimented on by a Professor Schottler. His results are printed in London *Engineer*. Its general plan is similar to that of the gas motor on the system of Wittig and Hees. The petroleum flows from a closed reservoir through pipes, in which there are two slide valves and one cut-off valve. It unites with the air introduced by the pump cylinder. The explosive mixture is compressed and then forced into the working cylinder, where it is ignited. In four trials the maximum force obtained was 4.5 horse power; the greatest number of revolutions was 103 per minute. The consumption of petroleum per hour for each horse power was 1¾ to 2½ pints. In this estimate of the consumption of petroleum, the quantity used for the kindling flame is not included, as it is fed from a special reservoir. It is stated that this petroleum engine costs no more to work than a gas engine. In regularity of working, the engine was found during the experiments to be superior to a gas engine.

CREAM OF TARTAR.

NEW YORK, *Dec.* 23, 1882.

To the Editor of THE SANITARY ENGINEER:

The proceedings taken by the State Board of Health against grocers for selling adulterated cream tartar have made an impression upon the consumer. I am asked now if the cream tartar I have for sale is pure—a question I do not remember being asked before the adulteration of the article was made public. Will you please say what amount or per centage of mixture is allowed by the Food and Drug Law and oblige, yours respectfully, GROCER.

[Something will certainly be gained if the consumer can be induced to ask if the goods he buys are pure. There is no difficulty in defining "pure cream of tartar." The last edition of the U. S. Pharmacopœia allows the presence of six per cent. of tartrate of lime; and as the Food and Drug Law recognizes the standards of the Pharmacopœia anything in excess of this amount is below the legal standard. Flour, ground gypsum, etc., is not allowed. This is the only article which can be sold for cream of tartar. At the same time the State Board of Health have the power to permit the sale of certain mixtures to take the place of this salt, but if such mixtures are sold for cream of tartar it is a violation of the law. Up to the present time the Board of Health have taken no action in regard to the establishment of standards. If the Board are not intending to recognize any "mixtures," the sooner this is made known the better.]

WHAT RETAIL GROCERS WANT.

The Retail Grocers' Association held a meeting in Beethoven Hall last evening and adopted resolutions that no member of the association should purchase goods of any jobber who would not give a written guarantee that they were pure and unadulterated, and that the Law Committee of the association should defend any member selling adulterated goods if the committee believed that they were bought in good faith and a fair price paid. A committee of five was appointed to confer with the State Board of Health in regard to the adulteration of food.—*N. Y. Times.*

[This is all right, but the committee should prosecute the wholesale dealer who sold the adulterated goods rather than resist the law, and not put their members to the cost of individually carrying on suits in such matters. The State Board could be of material assistance to them also.—ED. SANITARY ENGINEER.]

A meeting of farmers interested in shipping milk over the Erie Railway was held at Middletown, N. J., Dec. 26, and resulted in a permanent organization. The immediate purpose of the organization seems to be to control the price which they assert is now fixed by the dealers in their own interest. They also took action calculated to diminish the amount of skim milk put on the market, which has also tended to reduce the price at which the genuine article can be sold. The Erie Railroad offered to establish with other railways a can exchange, so as to furnish every facility for a milk inspector on trains who shall be authorized to dispose of adulterated or skimmed milk; to return all unsold pure milk to the farmers free of charge both ways; to collect the price of milk with freight when requested, and to remit it without charge. A mass meeting of farmers will be held at Goshen, January 6, to appoint milk inspectors and to carry the plan into operation.

A NEW LITANY.—District Visitor: "Your boy looks very bad, Mrs. Jones; what's the matter?" Mrs. Jones: "Yes, ma'am, he be very bad, and, what's more, the doctor has made him worse. I'm sure we poor people ought to pray with all our heart, 'From all false doctorin', good Lord, deliver us.' I never saw its meaning afore."—*Medical Times and Gazette.*

Correspondence.

HEATING STORES WITH STEAM.

OWEN SOUND, ONT., *Dec.* 23, 1882.

To the Editor of THE SANITARY ENGINEER:

We wish to heat our three stores with steam, and enclose a sketch showing our position. You will observe we have only three feet of cellar (exaggerated in the sketch), hence our main pipe, 2½ inches, will be as low as bottom of boiler. Sketch No. 2 will show position of heaters; the dotted lines show cross mains of 2-inch pipe. The circles (*R*) on sketch show position of radiators. Are mains right size to supply at a pressure of three pounds? Can we trap main steam pipe and all returns from heaters on ground floor through one large trap into cistern, or will we have to use one trap for main steam pipe and another for all the heaters, and at what position will we place our trap or traps, as the case may be? How would you advise getting water back from well to boiler (boiler cannot be lowered)? By answering this you will greatly oblige.

CONSTANT READER.

P. S. What number of tubes in each heater should we use?

[We would advise that the main (100 feet long and 2½-inch pipe) be run 4 inches from the dome of the boiler to the point marked *a*. A smaller pipe, 3½ or 3 inches, may be made to do, and unless one had an opportunity to contrast it with an apparatus with more ample mains, he might not be aware of the benefit he would have reaped. Use 4-inch pipe.

The cross branches of 2 inches are sufficient, but the radiator connections (shown 1 inch) could be increased to 1¼ inches at a small expense and reduced, close to the valve, to 1 inch, if necessary. This would give the water which will form within them a better chance to run back to the main, as it will be necessary to pitch the 2-inch pipes and their branches to the main, in such a contracted space.

A very good system of return pipes for an apparatus of this kind is to start at *b*, a few inches under the steam main (sufficiently low for its branches to cross below the main), and pitch in the same direction as the main; relieving the main at *a* into it and returning to the hot-well or trap through a separate pipe. The dotted lines *Q Q Q* show how this may be done. The branches of the return correspond to the steam pipes and pitch the same way. A 2-inch pipe, corresponding to the 4-inch, will do, and 1¼ to the 2-inch cross branches. A direct return trap would be the best under most circumstances, but with a pressure of 3 pounds we think they cannot be worked with any surety. On the other hand, if a steam pump is used, it will have to be constructed with special reference to such low pressure and will not be automatic, giving an irregular feed. Increase the pressure and use a trap is probably what you will have to do.

The gross amount of surface in square feet should not be less than 2,250.

The detail of the work should be intrusted to some one who has had former experience, as your arrangement suggests a problem not often met with.]

COMPETITIONS.

To the Editor of THE SANITARY ENGINEER:

I noticed in a recent issue of THE SANITARY ENGINEER, under "Proposals," a notice of a competition for public buildings for some town in Texas, to cost $75,000, the successful competitor to receive $100. What talent can be secured to study out the conditions involved in designing such a building and to cost such a sum for a remuneration of $100? It is very evident that the committee having charge of this matter is ignorant of the amount of study and the time it takes to produce a plan meeting all the conditions and demands of a building of this description. It would be a most excellent question for you to treat on—the lack of appreciation evinced by most people towards the services of an architect. The anecdote in issue of Nov. 30 is a good illustration of the general comparison of builder and architect.

[We frequently allude to the ignorance of building committees in adopting such methods to secure professional advice and assistance. But in a community that has few expensive buildings, and where the people in charge of the carrying out of such work have had little experience as to the value of a good architect's services, or the possible expense that the blunders of an incompetent man may entail, such an estimate of the value of professional service is not to be wondered at.

If any men are foolish enough to waste their time in preparing plans, and we believe there will be plenty of them, they must not be surprised if the committee appropriate the good features of the rejected plans, and pay the $100 to some one who has a friend at court. We hear of men engaged in such committee work who are considered honest and reputable, yet such practices they see no impropriety in.]

DOUBLE GLAZING.

ST. PAUL, MINN., *Dec.* 9, 1882.

To the Editor of THE SANITARY ENGINEER:

In your number of February 16, 1882, there is an article on double glazing, by Gen. M. C. Meigs. I would like to ask him, or anybody who has had experience in double glazing, whether the glass does not, in time, become dirty, on the inside from accumulating dust? I remember seeing some cellar windows double-glazed, which had become so begrimed on the inside of the glass as to be opaque.

A double or storm sash is almost always used here, but double glazing, in some cases, would be preferable if there are no objections to it.

If you can secure the attention of Mr. Meigs, or others of experience, to this, you will oblige,

Yours, etc., CHAS. A. REED.

We referred this question to General Meigs, who makes the following reply.

WASHINGTON, D. C., *Dec.* 22, 1882.

To the Editor of THE SANITARY ENGINEER:

I return the question as to double glazing.

On July 22 I began to occupy a new office with four sash windows double-glazed; interval between glasses one inch. The outer glass is set in putty and is air-tight. The inner glass is fastened by strips of wood bradded on the sash rails. This joint is not air-tight, and is not the

proper joint. I yielded my own judgment to the carpenter's advice, thinking, also, that in case of need, I could more readily take out the inner glass for cleaning. Thus far this has not been necessary, and I can see no obscuration of the glass. Glass over water-color paintings stands for years without removal for cleaning. I believe that if both glasses are well secured in putty no change could take place in the interior surfaces.

While on this subject I add a few observations of temperature, tending to show the value of double glazing.

Observation of temperatures in office room, No. 1316 N Street, N. W., Washington. Four windows double-glazed. Interval between glasses, one inch. Thermometer in middle of space between glasses.

Thermometer A on inside of wall by north window.

Thermometer B, between glasses in middle of lower pane, same window.

Thermometer C, on outside shutter.

Room: Interior dimensions 29 ft. x 24 ft. x 13 ft. Brick walls, wooden floor and ceiling, cellar below, and a room above; two outside doors and four windows; source of heat, open fire-place, wood fire.

Dec. 8, 1882, 5 P. M., Fahrenheit Thermometers, A, 56°, B, 38°, C, 19°.

The mean between outside and inside is 37½°.

All observations made during the season are consistent with these. Thermometer B never differs more than ½° from the mean. M. C. MEIGS.

SCREEN FOR COLD AIR BOX.

To the Editor of THE SANITARY ENGINEER:

NEW YORK, *Dec.* 12, 1882.

Please tell us how to filter the air as it passes through cold air box of heater, so as to exclude the dust without

Digitized by Google

too much obstruction to the flow of air? You may have published something upon the subject; if so, please refer me to the same. Yours respectfully, T.

[A sliding screen to be inserted in the cold air box of the furnace is shown in the issue of THE SANITARY ENGINEER of February 16, 1882. For the information of readers who have not that issue we illustrate a box and screen on the preceding page.]

A SEWER ORDINANCE.

To the Editor of THE SANITARY ENGINEER:

Not finding a sewer ordinance, such as I wanted to recommend to the Sewer Commissioners of Keene, N. H., for adoption by their city council, I have drafted an ordidance to suit my own ideas, a copy of which I send, with the wish that you will point out in THE SANITARY ENGINEER, what would seem advisable to change, to make the whole safer, more complete or less stringent. Whether they will adopt such an ordinance is another matter, and calls up the question, How much and in what particulars could this ordinance be safely changed, so as to make it less expensive to the inhabitants of that city? For it will be on the grounds of expense that objection will be made. The subject of sewer assessments being so closely connected with this subject of regulating the house connections, I have made a draft of an ordinance on this subject also, a copy of which is added.

The system of sewerage now being put in at Keene is Col. Waring's, the Drainage Contruction Co., contractors, and we have charge of the inspection for the city. They are now closing the season's work, about six miles of sewer pipe 6" to 15" having been laid since October 1. This is about half of the whole plan. One more question, How can the advantage of Col. Waring's plan of having the house connections made without running traps (thus securing ventilation by means of the soil pipes, the air passing down some and up others (?) (I think he claims) be gained, without great danger of carrying the emanations from one house to another, unless (as has been suggested by Mr. E. W. Bowditch) a special ventilating pipe outside the house takes the place of the soil pipe as a ventilator of the sewers (Sec. 4, 2, first ordinance)? And still another: Many of the house-owners, where the house connections with the sewer are most needed, being poor people, what is the cheapest arrangement that it has been found advisable to permit them to use in connecting with the sewer?

I should not neglect to acknowledge valuable suggestions from W. H. Bradley, Superintendent of Sewers, Boston, and E. W. Bowditch, as well as THE SANITARY ENGINEER, in preparing these ordinances.

Hoping that you have a good stock of patience and time in reading this, I am, sir,

Respectfully yours, EDWARD P. ADAMS.

AN ORDINANCE TO REGULATE THE HOUSE DRAINAGE AND THE CONNECTIONS WITH THE PUBLIC SEWERS.

Be it ordained, etc.

SECTION 1. That a Board of Health be chosen by the city council, to consist of three medical men, one member of the council, and a sanitary engineer, who shall be the Superintendent of Sewers. This Board shall have charge of all matters relating to the public health of the city.

SEC. 2. The Superintendent of Sewers shall have supervision of the construction and the repairs of all sewers and house drains, and shall keep a description with plans of the sewers and connections and an account of all expenses in his department.

SEC. 3. When the Board of Health shall deem any privy, cesspool or house drain to be a nuisance or a danger to the health of the inmates of the house or of others, they shall require the house to be drained and a connection with the public sewers to be made in accordance with the rules and regulations of this ordinance. And, in case of neglect to do this within two weeks' time from the receipt of the requisition of the Board, they may make such drains and connection at the owner's expense.

SEC. 4. The following regulations shall govern the planning of all house drainage and house connections with sewers.

1. For each building there shall be a separate connection with the public sewer of four-inch salt-glazed vitrified pipes, which may extend from the sewer to within five feet of the house; and from thence the house drain shall be four inch plain or enamelled heavy cast iron pipe or asphalt-coated wrought-iron pipe, and shall extend upward as a soil pipe above the highest part of the roof.

2. If the house drain runs under or through the house, a running trap and air inlet should be provided between the house drain and the street, with a special ventilating pipe, four inches in diameter, of cast iron, on the sewer side of running trap, extending above the highest part of the roof.

3. Every fixture shall be effectually trapped and every trap ventilated into a ventilating pipe not less than two inches in diameter and with joints air-tight, which shall connect with the soil pipe or the open air above the highest trap. Every sink drain pipe shall have a good grease trap.

4. No privy or cesspool shall be connected with the house drain or sewer. When water closets take their place, they shall be thoroughly cleaned out and filled with fresh dry earth.

5. No sub-soil drain shall be connected with house drain except at fresh air inlet, with provision for preventing the entrance of rats as well as sewer gas. Drip or safe pipes and rain water conductors should not be connected with the house drain, but empty into the open air.

6. Every water closet shall be of the hopper form (no pan closets allowed), adequately flushed with water from a cistern above it. Each water closet apartment should have a direct means of ventilation into the open air.

7. The arrangement of soil and waste pipes shall be as direct as possible, and the drain, soil and waste pipes, and the traps shall be left so that they may at all times be readily examined and repaired.

SEC. 5. All drain laying, repairs or connections shall be done according to the following rules, and if any drain be constructed or repaired or any excavation for that purpose, without a permit in writing from the Superintendent of Sewers, or in a mode different from that prescribed herein, the person doing such work and the owner or agent directing the same, shall respectively be liable to a penalty not exceeping twenty dollars.

RULES FOR DRAIN LAYING.

1. Before any connection with the public sewer is made or any house-drainage put in or any repairs on them, a permit must first be obtained and the plan proposed approved by the Board of Health. Permits when not used must be returned to the office of the Superintendent of sewers.

2. No pipes or other materials for the drains can be used till examined and approved by a duly authorized Inspector (appointed by the Superintendent of Sewers). All work must be inspected by him and done to his satisfaction.

3. At the time the permit is given to put in or to repair the house-drainage or the connection with the sewer, the applicant must fix the time for the Inspector to call. If, at the time appointed, the work to be inspected is not (in the judgment of the Inspector) likely to be ready within a reasonable time, the Inspector will not be obliged to wait, and the applicant must then make a new appointment at the office of the Superintendent of Sewers.

4. In opening any street or public way all the materials must be placed where they will cause the least practicable inconvenience to the public, and the whole enclosed with sufficient barriers and properly lighted at night from the beginning to the end of the work.

5. As little as possible of the trench must be dug until the Y-branch in the sewer is found. Whenever the sides of the trench will not stand perpendicular, sheeting and braces must be used to prevent caving.

6. The least inclination that can be allowed for house drains is one in sixty. When any change of direction is made in the pipe, either in a horizontal or vertical direction, curves must be used. No angles by clipping pipes or otherwise are allowed.

7. In the "house connection" every joint shall be laid with gasket and cement and bedded in hydraulic concrete at least four inches in depth. The house drain, soil pipe and special pipes must be calked with lead so as to be both water and air tight. Only wiped joints are allowed on lead pipes, and when a lead pipe is connected with an iron pipe, a special brass thimble with calked lead joint must be used.

8. The ends of all pipes not to be immediately connected are to be securely closed water tight with imperishable materials. The inside of every drain, after it is laid, must be left smooth and clean throughout its entire length, and true in line and grade.

9. The back filling over drains after they are laid must be puddled or rammed, all water or gas pipes protected from injury or settling, and the surface of the street made good, within forty-eight hours after the completion of that part of the drain lying within the public way.

SEC. 6. In case of neglect or refusal to remove, reconstruct, repair, alter or cleanse, any privy, cesspool, house-drain or house connection with sewer, for one week after the order or the Board of Health, they shall cause the same to be removed, reconstructed, repaired, altered or cleansed, at the expense of the owner, agent, occupant or other person, as the case may be; and he shall be liable to a penalty not exceeding fifty dollars.

AN ORDINANCE TO REGULATE SEWER ASSESSMENTS.

Be it ordained, etc., as follows:

SECTION 1. Every landowner whose property may be benefited by the building of any public sewer shall be assessed in proportion to the area of land so benefited, which benefit shall be considered to extend from the street line to a line 120 feet distant therefrom.

SEC. 2. Three-fourths of the cost of the public lateral sewers (six inches in diameter) and so much of the cost of the main sewers as shall be equal to the expense of constructing six-inch sewers of similar length along the same lines, including in both cases, the cost of connections from the sewer to the sidewalk line, shall thus be assessed. One-fourth of the above cost and the excess of the cost of main sewers shall be borne by the city.

SEC. 3. A map or maps showing the areas benefited by each main or lateral sewer shall be kept at the office of the Superintendent of Sewers, and all assessments shall be made in accordance therewith.

[So far as we can judge with our imperfect knowledge of your local circumstances the regulations appear all right. A clause, however, should be added giving the Board of Health power to modify or amend these rules as circumstances may require, and also to prescribe the conditions under which men can do plumbing work either as masters or journeymen. The question of the omission of the main trap rests entirely on the future successful working of your system. We have not sufficient knowledge of your conditions to justify us in giving an opinion.]

THE CHICAGO MASTER PLUMBERS.

(From our Special Correspondent.)

CHICAGO, *Dec.* 21, 1882.

The Master Plumbers' Association met this evening at No. 185 Clark street, Daniel J. Rock in the chair. The attendance was about 40. Andrew Young, in the paper of the evening, characterized the statement of a morning paper that 90 per cent. of the buildings of the city were unfit for habitation, owing to defective plumbing, as considerably exaggerated. He instanced several cases of butcher shops, recently unused saloons, from which the fixtures were taken away and the soil pipes left uncovered, the result being noisome air from open sewers. The City Hall, as well as the North Side County buildings, was in a bad condition. Referring to the inadequate means for flushing sewers, he gave a laughable description of the lumbering vans now in vogue, and advocated the sinking of artesian wells as the best substitute. As the water was strongly impregnated with sulphur, it would be valuable as a disinfectant. Speaking of food adulteration, he said bad plumbing could be remedied and broken sewers mended, but here was an evil that practically defied correction. The present Chicago Board of Health, for its inadequate force, did commendably, though practical plumbers should be represented on the staff. In closing, Mr. Young called attention to the terrible stenches too often emanating from stored food on certain produce thoroughfares. For his contribution the gentleman was unanimously thanked.

It was announced that Prof. Norman Williams, of the Northwestern University, would commence at the next meeting a series of sanitary lectures, under the auspices of the association, and all arrangements were referred to the Sanitary Committee.

Before the adjournment there was some discussion on the relation of the wholesale trade to the craft.

Architect Willett has yet to make up his mind as to the ventilation and sewerage defects at the north side county buildings where the vile stenches are credited with sending one judge to Florida and another to bed with pyæmia. Judges Williamson and Tuley, presiding in the criminal court this session, have again directed attention to the evil.

The latest action of the authorities is the appointment of Alex. W. Murray to investigate the whole sewerage and ventilation system of the buildings. Already he has found cesspools in close communication with ventilating shafts, and that four-fifths of the 212 cell waste pipes are untrapped.

The Board of Fire Commissioners of Jersey City have adopted a rule that all hotels, boarding-houses, schools, public buildings, factories and workshops, when they are three or more stories in height, must have external fire escapes. The penalty for failure to comply with the rule is a fine not to exceed $300.

The Grand Jury of the Kings County Court of Sessions have made a presentment, finding the old Raymond Street Jail, Brooklyn, to be a disgrace to the city and unfit for habitation by the lowest criminals. This jail affords a subject for Grand Jury comment, but apparently no notice it taken of the presentments. Perhaps when several more juries have had their say about it, something will be done.

The Academy of Science, at Rochester, N. Y., has organized a Hygienic Section, of which Dr. E. M. Moore is President, Anson C. Allen Vice-President, and Dr. Edward Angell Secretary. Lectures are to be given at the Society's hall twice a month.

The Engineers' Association of Rhode Island held a third anniversary celebration the 16th ult., with great success.

Reviews of Books.

HOUSE DRAINAGE AND SANITARY PLUMBING. By WILLIAM PAUL GERHARD, Civil and Sanitary Engineer. D. Van Nostrand, Publisher: Science Series. Paper, 50 cents.

This little book contains substantially the paper prepared for the Rhode Island State Board of Health, which, at the time of its publication, was favorably noticed in these columns. It has since been rewritten and revised in various parts and published in Van Nostrand's *Magazine*. It presents in a readable and convenient form, information that every householder, physician and architect should be possessed of.

We are pleased to note an absence of sensational statements and unwarrantable conclusions. The author frankly states that his "subject has been well and thoroughly treated by able writers, and his paper can hardly claim much originality or novelty," yet he has succeeded in condensing in one volume much information hitherto more or less scattered.

The statement that "any one building a house is able to secure good drainage and a safe arrangement of the plumbing work without having to resort to any patented system" is in accord with what we have often told our readers (and we still hold to that opinion), yet, in the face of this statement the author has, in the most important illustration in the book, namely, a sectional drawing showing "system of house drainage" selected certain forms of patented traps to serve fixtures so located that it would have been entirely feasible and better to use the ordinary traps and properly ventilate them.

It is to be hoped that further experience will induce him to change this in a subsequent edition.

What is to prevent the syphonage of the trap under the bath tub when the water closet is emptied, which, by the way, is a kind that discharges some four gallons of water, is not apparent.

The other statements in the book are so much in accord with our opinions hitherto expressed and still entertained, that we regret that in this case a good compromise should have been substituted where no compromise was needed; with the exception of this one illustration we have noticed nothing that we would take exception to, and we gladly commend the book.

HEALTH AUTHORITIES AT HOME AND ABROAD.

REPORT OF THE COMMISSIONERS APPOINTED TO INQUIRE RESPECTING SMALL-POX AND FEVER HOSPITALS. London, 1882. XXXV. Pp. 414. Folio.

This instructive and valuable report is the work of a Commission appointed in November, 1881, to inquire respecting the nature, extent, and sufficiency of the hospital accommodation for small-pox and fever patients in London, the best methods of providing hospitals for this class of patients, and the conditions to be observed in regard to such hospitals so as to insure as far as possible the recovery of the patients and the protection of the public against contagion. The members of this commission were: Frederic, Baron Blachford; Sir James Paget; Sir Rutherford Alcock; Arthur Wellessley Peel; Edward Leigh Pemberton; John Broden Sanderson; Alfred Carpenter; William Henry Broadbent, and Jonathan Hutchinson, to whom was added as Secretary, Nathaniel Baker, Barrister-at-law.

The Commission accepts the conclusions of Mr. Power with regard to the effect of small-pox hospitals as centres of infection (see SANITARY ENGINEER, Oct. 19, 1882, p. 427), and estimates that the maximum number of small-pox patients to be provided for at one time is 2,700. About 2,200 of them can be safely sent several miles by land, and these should be cared for in hospitals situated in the country at a distance from London. There will remain four or five hundred cases too ill to be removed to any distance. Some of these might be treated in hospitals on or near the river Thames, and the rest be cared for in a few small hospitals of improved construction and management, in connection with the fever hospitals or elsewhere.

The Commission conclude that all evidence goes to show that well conducted fever hospitals involve no appreciable risk to the neighborhood, and that under proper precautions a limited number of small-pox cases (30 or 40) may, without sensible risk of infection, be received within the precincts of a fever hospital.

They think "That every person suffering from an infectious disease, or those in charge of him, or if these neglect their duty, the occupier of the house in which the sick person is residing, or, if he is a pauper, his medical attendant, should be required by law to notify the nature of the disease to the medical officer of health so soon as they or any of them are aware of it; and that in the case of non-paupers, the medical attendant should, if it is inexpedient to impose any further obligation on him, be similarly required by law to furnish the sick person, or those in charge of him, with a certificate of the nature of the disease in the form which we have already suggested, to be by them communicated to the medical officer of health. On every certificate so communicated a small fee should be paid to the medical man who signed it." It will be seen that this is in substantial accord with the views heretofore expressed by THE SANITARY ENGINEER with regard to the compulsory notification of infectious disease.

It is recommended that the provision of hospital accommodation for persons suffering from infectious disease in the metropolitan districts should be entirely disconnected from the administration of the poor law, and placed under one central authority. That this is wise there can be no doubt. They advise that the power of arresting the operations of the hospital authorities by injunction should be taken away. "It is incompatible with the public safety that individuals should possess the power of suddenly paralyzing institutions which furnish for the time the only machinery of controlling an epidemic." Did space permit we should be glad to quote further from this report, which is one that does not permit of condensation, and is characterized by clear practical good sense The minutes of evidence taken, with various appended documents which accompany the report, contain a vast amount of interesting matter, and the whole forms a volume which every one who is specially interested in the problems of dealing with infectious disease in a large city should possess.

FOURTH ANNUAL REPORT OF THE STATE BOARD OF HEALTH OF ILLINOIS. (For the year 1881). XXXII., 213 pp. 8 vo. Springfield, Ill., 1882.

The greater part of the work of the State Board of Health of Illinois is connected with the enforcement of what is known as the Medical Practice Act, and this, as the Board remarks, "with the limited means and clerical force at its disposal, have hitherto precluded as much attention being given to some forms of purely sanitary works as is deemed desirable." Nevertheless, the Board has done important work during the year with reference to small-pox, in part by its coöperation with the National Board in securing the inspection and vaccination of unprotected immigrants, in part by its requirement that on and after January 1, 1882, no pupil shall be admitted to any public school in the State without presenting satisfactory evidence of proper and successful vaccination, the result of which order will appear in the next report.

For the twelve months preceding the establishment of the immigrant inspection service it is stated that "it had cost municipalities and citizens of Illinois not less than $100,000 to care for outbreaks of small-pox directly caused by these unprotected immigrants. This is the actual money cost, and does not include the constructive cost of injury to business, loss of time, etc. Since the beginning of these inspections there has not been a single outbreak in the State due to immigrants, and only one case among the immigrants themselves." The Board has the right to refer to this matter with self-satisfaction for this result, and indeed the organization of the service itself is mainly due to the energy of its secretary, Dr. John H. Rauch, who has acted for the National Board as Supervising Inspector of the Western District, and the publication of whose monthly reports has had an excellent effect on the work done by the steamship companies. This Report also contains the proceedings of the Sanitary Consul of the Mississippi Valley, which we are glad to see thus recorded and preserved.

The total expenditures of the Board for all purposes during the fiscal year, were $5,754.25, and it is evident that the money was well spent. The Board is to be congratulated on the results it has achieved, and it is to be hoped that it will soon be able to devote more of its time and energy to the strictly sanitary interests of the State, while not relaxing in any way in the good work which it is doing under the Medical Practice Act.

NINTH ANNUAL REPORT OF THE SECRETARY OF THE STATE BOARD OF HEALTH OF THE STATE OF MICHIGAN, for the fiscal year ending Sept. 30, 1881. LXII., 501 pp. 8vo.

This large volume represents a vast amount of work. On the title page we are met by a new device for a seal for a sanitary body, being a doorway in a wall. The keystone of the arch of this doorway is labelled Vital Statistics, and the stone at the threshold is Truth. At first we thought that the door was open and that the arms of the State of Michigan were to be seen through it, floating in a cloudless sky. Closer examination, however, showed that the door was shut, but the indication of a few planks on it would be an improvement, and still better would be a curtain in its place—the veil of Iris. The first part of the volume is occupied with the report of the Secretary, Dr. H. B. Baker, relative to the work of the Board. The second part includes papers and addresses presented at sanitary conventions held at Flint and Battle Creek, and eighteen papers and reports prepared for the Board. Among these we would specially commend a paper on the Systematic Study of Causes of Sickness and Death, by Dr. Baker; one on Nostrums, by Prof. A. B. Prescott, of the University of Michigan, and one on Sanitary Rules *versus* Medical Theories, by Dr. Foster Pratt, of Kalamazoo. Dr. Baker truly remarks that popular books and articles are not usually "contributions of science" and that really valuable contributions to science are not commonly easy and pleasant reading. He illustrates the relative prevalence of certain diseases in Michigan at different seasons of the year by some effective diagrams, and points out some deductions from the vital statistics of the State. For instance, diseases of the lungs cause nearly one-fifth of all the deaths reported, probably 2,000 dying each year from consumption; and there are twice as many deaths from whooping cough as from small-pox. The contrasts between intermittent and typhoid fever as to season of prevalence are well shown in diagram 3. Prof. Prescott gives the composition of some of the numerous nostrums on the market, such as pain killers, ague cures, etc., showing that they are either worthless or are common prescriptions sold at a hundred times their cost.

Dr. Pratt gives a graphic description of the results of attempting to enforce the law which was designed to make the reporting of cases of diphtheria compulsory, and concludes that it is necessary that the law should specify by name the diseases to which it is intended to apply.

The paper on the Relation of Preventable Sickness to Taxation, by Dr. J. H. Kellogg, of Battle Creek, presents the subject of sanitation in a business point of view. He concludes that the annual loss to the State of Michigan from preventable diseases is over six millions of dollars, and that it may amount to ten millions.

The last hundred and sixty-six pages of the volume are filled with a compilation of the weekly reports of correspondents of the Board, and with a report on the principal Meteorological Conditions in Michigan during the year. These have been compiled by the Secretary, who has given a great amount of labor to their compilation and analysis. The volume is one that is creditable to the Secretary and the Board, and we commend it to all who are interested in State sanitary work.

ROCHESTER, N. Y., ANNUAL REPORT OF THE EXECUTIVE BOARD, for the year ending April 3, 1882.

The Water Works, Streets, and Fire Departments of Rochester are in charge of a Board of three citizens, one of whom is elected by popular vote each year. Their annual report, embracing the detailed reports of the several departments and many statistical tables, makes a pamphlet of 92 pages.

The report of the Board itself is concise and businesslike, with a little tendency, however, to "fine writing" and the use of too many adjectives, such as, "magnificent," "splendid" "unequalled," and of course "our fair city" and the "fire fiend" are brought in. Such stuff is out of place in business documents and makes them ridiculous.

The report of Mr. Tubbs, the Chief Engineer of the water works, is clear and satisfactory in most respects. There are some serious omissions, however.

The average daily consumption for the year is given, but not the variations during the different months of the year. This is always interesting and instructive, as showing how the waste increases in the very cold weather. The number of taps or connections is not given. This ought always to be stated in a report, and in this respect the Louisville report, which we noticed a few days ago, is a model. It gives a tabular statement of the number and sizes of taps in the mains.

The number of meters is not given, nor the proportion of the water used that is metered. No record is given of the work of the pumping engines on the direct-supply system. This omission might lead some captious critic to

Digitized by Google

doubt whether that "adjunct" to the water works is as great as it has been claimed to be, especially as in the fire department report it appears that out of 64 fires extinguished by water, the direct pumping works put out 17 without other aid than chemical extinguishers and the gravity works put out 44 unaided except by extinguishers.

Eight pages are occupied with a table of the exact location of the stop cocks on the main pipes, but no table is given of the location of the hydrants. This is a little odd, for no one but employés of the works have occasion to know where the stop cocks are; but many citizens, and particularly the firemen, like to know the location of fire hydrants.

The report of Mr. Peacock, the City Surveyor, gives good statistics of the extent and condition of the streets and sewers. There are 205.71 miles of open streets in the city, of which 49.81 miles are paved with Medina stone, Telford-Macadam, cobble-stones, gravel and wood. These are named in what Mr. Peacock considers the order of their usefulness and value. There are 87¼ miles of sewers, of the sizes and location of which a detailed table is given. Some of the sewers, east of the Genesee River, which runs through the city, empty into open ditches leading to Irondequoit Bay on Lake Ontario. The construction of an intercepting sewer which will convey this sewage to the Genesee River, is recommended. Such a sewer would enable 16 miles of open ditches to be abandoned.

There is no index or table of contents to the report.

"What is expert testimony and who are experts?" is the title of a paper read before the New York Medico-Legal Society on the evening of Dec. 6, by O. W. Wight, M.D., Attorney and Counselor at Law. Dr. Wight is well known as an energetic health officer, and being both a lawyer and a doctor, has the advantage over those who have studied but one of these professions. His paper is rather legal than medical, and contains some rather sharp remarks about medical experts, with regard to whom he seems inclined to agree with the remarks made by Judge Davis, of Maine, *i. e.*, "If there is any kind of testimony that is not only of no value, but even worse than that, it is, in my judgment, that of medical experts." If for "medical experts," in the last clause, we substitute the words, "the majority of those who present themselves as medical experts," the opinion would be sound.

The greater part of Dr. Wight's paper is devoted to the discussion of expert testimony in cases of insanity, but some of his conclusions apply equally well to expert testimony in sanitary matters; such, for instance, as was given in the recent malaria trial in Massachusetts.

The fundamental difficulty in the matter is, who is to decide as to who are really experts? So long as it is left to the parties in a suit to decide this matter, so long the trouble will continue. When this responsibility is placed directly and exclusively on the judge, and the expert is considered to be the adviser of the court, and not the attorney for the plaintiff or defendant, matters will rapidly mend. The paper is an interesting one to both physicians and lawyers, which was what was to be expected of its author.

Vick's *Floral Guide*, for 1883, brought out this year by the sons of Mr. Vick, fulfills the desire of its founder, lately deceased, "to have each succeeding edition superior to the preceding one." It presents several finely-colored plates of flowers and vegetables with full catalogues and information on the subject.

MANAGEMENT OF INFECTIOUS DISEASES.

The report of the Royal Commissioners appointed to inquire respecting small-pox and fever hospitals in London, recently issued, contains the following practical remarks as to the management of infectious diseases:

"Upon one cardinal point the evidence which we have received is almost absolutely unanimous. On the outbreak of an infectious disease the first imperative necessity is to isolate every case immediately and effectually as it arises. On the one hand, such isolation with its incidents almost invariably answers its purpose. We are told with confidence that when in the earliest stage of such a disease the patient is removed to a hospital, the house, its contents, and the adjacent drainage disinfected, and, in the case of small-pox, the neighbors re-vaccinated, no further apprehension need be felt on the score of that house. When this precaution is neglected, the contrary result follows. In one instance 20 cases of small-pox, in another 25, in another 23, in another 16 deaths, and 20 cases were distinctly traced to one case of concealment, and the consequent absence of isolation and disinfection. Each freshly infected house tends, if neglected, to become a new source of contagion, and the whole to swell into an uncontrollable mass of disease." * * *

"We are of opinion that the provision of hospital accommodation for persons suffering from infectious disease in the metropolitan districts should be entirely disconnected from the administration of the Poor Law, and treated as part of the sanitary arrangements of the metropolis. We think that the conduct of the hospitals cannot be better placed than under the management of the Metropolitan Asylum Board, with such changes in their mode of election as shall give the sanitary authorities in London—that is to say, the vestries, district boards, and commissioners of sewers—at least an equal influence with the guardians of the poor in the choice of the elective members of the board. We think that every person suffering from an infectious disease, or those in charge of him, or, if these neglect their duty, the occupier of the house in which the sick person is residing, or if he is a pauper, his medical attendant, should be required by law to notify the nature of the disease to the medical officer of health so soon as they or any of them are aware of it; and that, in the case of non-paupers, the medical attendant should, if it is inexpedient to impose any further obligation on him, be similarly required by law to furnish the sick person, or those in charge of him, with a certificate of the nature of the disease, in the form which we have already suggested to be by them communicated to the medical officer of health. On every certificate so communicated a small fee should be paid to the medical man who signed it. If the medical officer after receiving such a certificate is satisfied that the patient can and will be properly isolated, and requisite means of disinfection adopted, the matter will proceed no further. If he is not so satisfied, and if the sick person is not too ill to be removed, he will notify the case to the Metropolitan Asylums Board; who will thereupon be at once and entirely charged with the patient till his complete recovery, and, in particular, will be empowered to remove him at once to one of their hospitals. So far no distinction should be made between paupers and non-paupers who cannot be isolated. But within the hospital those who are desirous of being placed in separate wards should be allowed such accommodation on paying for it. In case of ordinary accommodation, it appears to us a question whether payment should be claimed even from those who can make payment without difficulty. If the sick person cannot be removed or isolated by those about him, the medical officer will be bound to take all necessary steps for his isolation, and generally for the protection of the neighborhood, with power to clear the house of its inmates. In all cases he will be bound to disinfect the house, and in case of houses invaded by small-pox, should be empowered to require the re-vaccination of all occupants who are not otherwise protected. We are led by the concurrent evidence of several experienced witnesses to hope that the immediate and complete isolation which ought to be secured by these means will greatly diminish the amount of small-pox, scarlet fever, and typhus in London. With regard to these, and also to typhoid, still further diminution may be anticipated if the attention of the proper authorities is directed to the removal of all local cause of disease, and to the constant employment of means of disinfection. And we feel bound to repeat our conviction that small-pox would be still further reduced if vaccination could be made more effectual and re-vaccination more frequent."

PLUMBING LAW VIOLATIONS.

No very serious violations were reported by the inspectors during the past week. Minor violations were reported as follows: by Inspector Hooper four, Hollick three, Elliot two and Golden one.

The death of C. V. Walker, President of the Society of Telegraph Engineers, is announced by cable from England.

Several milk producers were before the courts at Camden, N. J., last week on charges of adulterating their milk, preferred by Dr. N. R. Newton, State Milk Inspector.

An ordinance passed by the Cincinnati Aldermen, the 23d ult., devolves upon the Smoke Inspector, the duty of looking after fire escapes.

CINCINNATI'S WATER WORKS.

Cincinnati, Jan. 1.—The Water Works Company completed their improvement and turned on the water this afternoon. This improvement gives the city a capacity of 15,000,000 gallons every 24 hours.

In the second week of December there was great scarcity of water in North Eastern Pennsylvania. In Scranton the water company issued notices to consumers to be sparing in the use of water. All through Wayne, Susquehanna and Wyoming Counties wells and springs gave out and there was trouble getting a sufficient supply for stock watering and household use. It was due to the light rainfall and the severe cold weather coming on suddenly and early.

AWARD OF BIDS IN NEW YORK CITY.

NEW YORK.—The following bids were opened at the Department of Public Works on the 27th of December:

For furnishing and delivering stop cocks, stop-cock boxes and hydrants, as follows:

	Three 48-inch Stop Cocks and gearing.	Eight 36-inch Stop Cocks and gearing.	One 30-inch Stop Cock and gearing.	Ten 12-inch Stop Cocks and gearing.	Ten 6-inch Stop Cocks and gearing.	Ten No. 1 Stop Cock Boxes and Covers.	Ten B Hydrants.
Geo. H. Robinson	$2,785.00	$1,550.00	$1,020.00	$62.00	$29.75	$38.40	$83.00
Chas. C. Field	2,772.50	1,540.00	1,075.00	59.00	28.75	37.70	79.75
Julius Jonson & Co.	2,800.00	1,550.00	1,100.00	58.75	28.75	37.75	79.75

The award was made to Charles C. Field.

For furnishing, delivering and laying a 48-inch cast iron conduit pipe from Woodlawn station to the reservoir at Williamsbridge, and 36-inch cast iron pipe around the reservoir, and from the same to the Croton aqueduct and to Jerome Avenue.

Florence Iron Works	$310,277.00
James Baird	297,999.00
T. E. Cronnin	341,507.00
Frank Stollmeyer	319,906.00
Theo. Sturges	321,492 50

Awarded to James Baird.

For hauling and laying a 48-inch cast iron conduit pipe from Midland Avenue to Station 522, between Tuckahoe and Bronxville, Westchester Co., there were nine bids, of which the lowest was $37.052, by Frank Stollmeyer, to whom the contract was given.

For alteration and improvement to sewer in Fifth Avenue, between 59th and 60th Streets, the lowest bid was $2,160, by E. M. Lynch, but this will probably be rejected as informal, and the contract awarded to the next lowest bidder, J. Baird, whose price is $3,128.

The following contracts were awarded (to the lowest bidders) from proposals opened the same day (December 27):

For sewer in Beekman Street, between Water and South Streets, to P. Mulholland, for $2,225

For sewer in 135th Street, between Fifth and Seventh Avenues, to J. S. Masterson for $7,639.

For sewer in 135th Street, between Seventh Avenue and summit west of Seventh Avenue, to J. S. Masterson for $750.

For flagging sidewalks four feet wide on 98th Street, between Eighth and Ninth Avenues, to James Slattery, for $1,617.50.

On December 30, two bids for flagging sidewalks and setting curbstones on streets surrounding Fulton Market were opened. The lowest was $8,950, from P. Gallagher.

(For Construction Notes see page 106.)

Digitized by Google

STEAM HEATING APPARATUS IN THE KALAMAZOO INSANE ASYLUM.

To the Editor of THE SANITARY ENGINEER:

Herewith I send you a detail of the radiator, etc., as planned by C. M. Wells, C. E , architect for the remodeling of the steam heating apparatus of both the male and female insane asylum, at Kalamazoo, Mich.

Originally the buildings were planned by Dr. Van Dusen, the medical superintendent at the time, and the heating apparatus was erected by Joseph Nason, of New York. The system then used was chamber heat; all the coils for each building were massed at the extreme end of an air duct, away from the main building, which connects with a passage *D*, shown in cut, and the air was forced by a fan driven by an engine, sending the warmed air through the plenum *D* and through the flue *E*, to the rooms and halls. In time it was found that though a fan could force air

sufficient for a whole building, and there was possibly enough pipe surface, yet, in windy weather, it was impossible to warm certain halls depending on the direction of the wind, the outside pressure forcing back the warm air. The management then, as a matter of experiment, added supplementary box coil and placed under the entrance to the flues *E*, which were found to require them most. The experiment proved satisfactory and gradually the engineer, under the direction of the medical superintendent, removed the original coils and distributed them throughout the plenum, and boxed them with wooden casings. In this condition (necessarily a patch work) the apparatus was used, the fan being still retained until the spring, 1881, when the Legislature voted money, at the request of Dr. Palmer, the present medical superintendent and the commissioner for the entire remodeling of the apparatus on the same principle with regard to the disposition of the heating surface, and in respect to piping adopted the low pressure gravity system, still retaining the fan, though not always having to use it, as each flue has its separate heater with the new system.

The diagram is a cross section of the passages under the buildings with a total length of about 2,200 feet. *A*, is the main steam pipe hung on expansion hangers which are adjusted by a nut in the bracket *G*; *a*, *a*, the steam connection to radiator, and are purposely elbowed up and down as shown, to compensate for the expansion of the main; *B* is a radiator of the cast iron extended surface pattern (much liked by the engineers) and *b*, *b*, are the return water connections to the main returns *C*, *C*. The object in having two main return pipes is to prevent the too frequent crossing of the passage with small pipes; *F* is a galvanized iron coil casing or hood, arranged to be taken off for cleaning or repairs and is open at the bottom as shown by the arrows.

With this method there has been no trouble to get a uniform heat throughout the buildings, each flue doing its full duty independent of the others.

Not wishing to trespass on your time or appear tedious,

I am respectfully yours, "T."

N. B.—The successors of Joseph Nason, the Nason M'f'g Co., were the contractors for the new work.

Construction Notes.

We shall always be glad to receive items of interest for this column.

WATERBURY, CT.—The authorities are busy preparing plans for the proposed sewerage works. It is now expected that bids will be advertised for in February.

ALLEGHENY, PA.—Proposals for the construction of one or more pumping engines, with all necessary masonry and pump house, will be received by James Brown, Comptroller, until January 15.

BOSTON.—The new Children's Hospital, on Huntington avenue, is now completed and was opened to visitors Dec. 20. Its cost is $125,000; the architects are Messrs. Winslow & Wetherell and N. J. Bradler.

BOSTON.—The Boston Park Commissioners having obtained the necessary legislation preliminary to the conversion of Muddy River into a charming parkway, so to speak, after the plans prepared by Mr. Fred. Law Olmsted, ask the city government for an appropriation of $400,000 to execute the improvement. The sanitary condition of this stream, which is now nothing but a filthy sewage receptacle between Boston and Brookline, is so bad that prompt action ought to be taken in the matter.

The pond in the Public Garden in Boston is also in bad condition. The water is offensive at times both to sight and smell. Mr. Wightman, the City Engineer, thinks the trouble is due to the mingling of fresh and salt water in the pond. The bottom is firm gravel, with a few deep holes. Mr. Wightman recommended that these holes be filled with clean gravel and the bottom covered with 3 inches of Portland cement concrete. The gravelling would cost $5,000 and the concreting $13,000 more, so the Aldermen split the difference and appropriated $10,000 for the work.

SAN FRANCISCO.—The supervisors of San Francisco, Cal., have at length adopted an ordinance fixing rates which the city must pay the Spring Valley Water Co., for water used for public purposes. This result was only brought about under pressure of a judicial mandate. The supervisors wanted the company to furnish water free of cost. This the company naturally were unwilling to do, and Mr Charles Webb Howard, the energetic President of the company, prepared at great labor and expense, statements showing that in all the large cities of the country, the property owners as independent of the water consumers contributed a liberal share of the cost of the water works, and he maintained that is was but just that property should be taxed for the benefits it received from a water supply, in increased valuation and reduction of rates of insurance. The Supreme Court of California decided that this view of the case was correct and ordered the supervisors to pass the requisite ordinance.

MONTREAL.—The sewerage of the suburbs of Montreal is expected to be discussed vigorously at the coming session of the Provincial Legislature. Last year the bill proposed was defeated, owing to the opposition of the Montreal aldermen to permitting the suburban sewerage to pass through the city sewers. This is carrying out the "separate system" with a vengeance.

ALBANY, N. Y.—Bids were opened December 28, at the Treasury Department, for furnishing all the plate, double-thick sheet; double-thick sheet, ground cathedral and enamelled sheet glass for the Post Office:

Bidders.	*Amount.*	*Deduct'ns For Free Duty on Foreign Glass.*	*Time.*
*De Pauw Plate Glass Co.	2,975.00	.....	30 days.
E. A. Boyd & Sons	3,006.00	2,232.35	.....

London and Manchester P. G. Co.	3,281.50	2,333.50	3 "
Hervy & Marriner	3,342.00	2,392,00	6 "

* Award will be made to De Pauw Plate Glass Co.

NORFOLK HARBOR.—Abstract of proposals received for dredging at Norfolk Harbor, Va., December 22, 1882:

Name and Address.	*Time Commence.*	*Time Complete.*	*Daily Am't of Work Expected cu. yds.*	*Price per cu. yd.*
Morris & Cummings Dredge Co., Norfolk, Va.	Jun. 10, '83	.....	.....	17 5-10c.
Geo. C. Fobes, Baltimore, Md.	Feb. 1, '83	Nov 30, '83	.....	17⅜c.
*Potomac Dredge Co., Washington, D. C.	.....	.....	.....	14c.
Moore & Wright, Portland, Me.	Feb. 1, '83	Nov 30, '83	.....	18c.
†R. G. Packard, Pres. Atlantic Dredging Co., B'klyn, N.Y.	.....	.....	.....	17c.
F. B. Cotton, Gen'l Manager Nat. Dred. Co., Wil'gt'n, Del	Jan. 15, '83	Nov 30, '83	.....	16 9-10c.

* Proposal not in accordance with the specifications.

† Bid made on condition that towing can be done any time, night or day, when tides and weather would permit.

ARCHER'S HOPE RIVER, VA.—Abstract of proposals received for dredging at Archer's Hope River, Va., and opened on December 22, 1882.

Name and Address.	*Time Commence.*	*Time Complete.*	*Daily Am't of Work Expected cu. yds.*	*Price per cu. yd.*
James Caler & Son, Norfolk, Va	Ap'l 1, '83	Jun. 30, '83	....	27½c.
Potomac Dred. Co., Wash'n, D. C	At Once	as sp'cifi'd	400	30c.
Geo. E. Ward, Alexander, Va.	Ap'l 1, '83	Jun. 30, '83	300	28 9-10c.
Joseph Baker, Norfolk, Va.	.....	Jun. 30, '83	....	37½c.

CHICAGO.—The building of the Electric Light Company's tunnels progresses in good earnest at 39th street and Wentworth avenue, one hundred men being employed.

NEW YORK.—The time for receiving proposals for cleaning the streets has been extended to Jan. 15.

SOUTH NORWALK, CT.—Proposals for constructing an iron swing bridge over the Norwalk River should be addressed to E. Hill, South Norwalk, or to A. B. Hill, the engineer, New Haven, Ct. Bids will be opened Jan. 31.

PORTSMOUTH, VA.—Water works are contemplated for the cities of Portsmouth and Gosport, Va., opposite Norfolk. The supply is obtained from the "Dismal Swamp," which, contrary to anticipation, is of excellent quality and abundant in amount. The conduit will be 6½ miles and the distribution pipes ten miles long. As the entire country is almost a level no gravity supply is possible, and direct pumping will be resorted to.

PHILADELPHIA.—Bids for supplies for the water works were opened Dec. 27. Among them were the following of interest to our readers: American pig lead, Tatham Bros. at $4 94 per 100 lbs., the only bid; cast iron service pipe, Gloucester Iron Works, $1\frac{9.8}{100}$ cents per pound, special pipe castings, $2\frac{7.5}{100}$ cents per pound, Millert Foundry Co.; $1\frac{6}{10}$ cents for cast iron service pipe and three cents for special pipe castings; brass castings, F. J. Clamer, 18 cents per pound, yellow brass castings, 22 cents per pound (the only bids). David S. Crosswell put in the only bid for shop castings and specialties in piping at $2\frac{8}{10}$ cents per pound.

CHICAGO.—Mayor Harrison of Chicago, speaks approvingly of his conduct of the city government during the past year. Regarding street pavements his statements are as follows:

"More streets have been paved during the past year than ever before during any one in the city. The greater portion of these have been laid with cedar block, although

Digitized by Google

the city is progressing toward a more permanent pavement. During the year the first pavement of granite blocks was laid on Monroe street, between State street and Wabash avenue. As this is a new pavement in Chicago, it may be well to briefly state the manner in which it is laid. The street is first rolled with a sixteen-ton steam-roller and then covered with four inches of macadam limestone and again rolled. It is then covered with a two-inch layer of gravel in which the granite blocks are imbedded. The interstices between the blocks are filled with dry lake-shore gravel mixed with asphalt cement, thus making it impervious to the water. This is now considered the best known pavement for the business portion of a city. The cost is four dollars per square yard, and it is claimed that it will never wear out. Another pavement that has practically been introduced this year in the asphalt block pavement that has been laid on Wabash avenue. The pavement being a new venture, the department, in order to test it thoroughly, provided that the contractor should keep it in repair for five years after the completion of the work. This pavement costs $3.03 per square yard. Still another pavement that has been introduced is the sheet asphalt, which is laid on the macadam pavement without the blocks. A portion of Park avenue has been paved with it, and it has been used extensively in Washington city. All of the alleys in the business portion of the city have been paved with the Medina stone block on a foundation of gravel, at a cost of $3.50 per square yard, Another improvement is the changing of the catch-basin from the intersection of street corners to the curbstone on a line with the buildings."

During the year 1882 Chicago has laid nearly 20 miles of new water mains, making the total in use 514 miles or about the same as there are in New York city. The daily consumption is nearly 70,000,000 gallons.

HALIFAX.—Mr. E. H. Keating, M. Am. Soc. C. E., the City Engineer of Halifax, N. S., is on a tour of inspection under orders from the City Council to visit various seaports on the Atlantic coast to examine the dry docks and report on the advisability and cost of a dry dock at Halifax.

Insurance Society says that prominent business men are agitating for the erection of new water works in Brantford, Ontario, in order to obtain a supply for household purposes. The springs to the north of the city, and Blue Lake, nine miles distant, are urged as sources of supply. The sanitary condition of the city is far from satisfactory, and those best versed in the matter are most fearful of the results, unless remedial measures are adopted.

In a suit in Cincinnati for the vacation of an assessment for a sewer, Judge Harmon decided that as the cost of the sheeting and shoring, amounting to one-eighth of the cost of the work, had not been let by advertising for bids, the whole assessment was invalidated.

A contractor, in Philadelphia, bid on a sewer at so much a foot, basing his figures on a profile exhibited by the State Department, which indicated the material to be encountered in the excavation as gravel. In excavating the trench a considerable amount of solid rock, requiring blasting, was encountered. The Comptroller refused to pay any extra price for this, and the contractor sued and recovered judgment against the city for $470.88, being 50 cents per cubic yard on the rock excavated. The decision was based on the representations of the profile. The moral to engineers is, be careful what you show on your plans and profiles. It is best and fairest to all parties to make preliminary test pits or borings. In the absence of these, make no statements as to character of unseen materials, but provide specially that all unseen is at the contractor's risk.

(For Award of Bids in N. Y. City see page 105.)

PHILADELPHIA SEWERAGE.

Mr. Russell Thayer, the Superintendent of Fairmount Park in Philadelphia, has submitted to the Park Commissioners a report on the nuisance created in the Schuylkill River opposite the Park by the pollution of Dobson's Run, a small stream which enters the river at that point.

Two small brooks, each about three-quarters of a mile long, unite one and three-quarter miles from the river, and form Dobson's Run. Near their confluence the stream is dammed for manufacturing purposes by the Messrs. Dobson. Above the dam the water is not polluted. Below the mill it is discolored by dyestuffs, principally logwood, and receives the sewage of a number of houses on its banks. It is also stated that "washings" from Dobson's mills pollute the water, but as the nature of the operations carried on in the mills is not given in the report, no opinion can be formed as to the nature or extent of this pollution. The sewage of the operatives at the mills is not allowed to enter the stream. The débris brought down by the stream in freshets has formed a bar at its mouth, which, during seasons of low water, presents an unsightly appearance. Whether this deposit is also offensive to smell, Mr. Thayer's report does not state.

He suggests as possible means of preventing future inconvenience from this polluted stream six projects. These are: (1) An intercepting sewer on the east bank of the Schuylkill, to carry off the ordinary flow of Dobson's Run to below the Fairmount Dam, with storm overflows into the river. (2.) A sewer or canal on the west side of the river, the water of Dobson's Run being convyeed to it by a submerged syphon. (3.) A short intercepting sewer on the east bank, from which the sewage might be pumped into the system of sewers which discharge into the Delaware River. (4.) The separation and purification of the Dobson's Run sewage. (5.) The construction of an intercepting sewer on the east bank, as in the first plan, but carried further down stream, so as to prevent the possibility of the flux and reflux of the sewage with the tide in front of the city; and (6.) The absolute exclusion of all polluting matter from Dobson's Run. No estimates of cost are given, but the recommendation is made that surveys and examinations be ordered which will make the preparation of intelligent estimates possible.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

MISCELLANEOUS.

CINCINNATI.—Eastern av, nr Washington st, fr; cost $7,500; o and b. John Price.

TOLEDO, O.—Grain elevator corrugated iron; cost $225,000; o, Union Elevator Co; a and b, J. A. McLennan.

DETROIT, MICH.—Grain elevator, corrugated iron; cost $300,000; o, Union Depot Co; a and b, J. A. McLennan.

JOLIET, ILL.—Grain elevator corrugated iron; cost $225,000; o, Joliet Elevator Co.; a and b, J. A. McLennan.

RAVENSWOOD, ILL.—Br and st church; cost $7,000; o. All Saints' Epis. church; a, J. M. Willet.

LE MARS, IOWA.—Opera House, cost $30,000; Warren and Sammis, a, Correy; b, Loft.

SIOUX FALLS, IOWA.—Dwelling; cost $3,500; E. P. Beebe, a, G. G. Baldwin.

A market company in Dublin has been tearing down numbers of diseased and rickety tenement houses and putting up handsome new market buildings.

A trunk belonging to a passenger who had come East from Cincinnati sick with small-pox, was taken from the Albany depot of the Albany & Susquehanna Railroad, the other day, by the Health Officer, Dr. O'Leary. The Board of Health has ordered an investigation into the circumstances connected with the transit of a passenger sick with that disease.

NOT AN UNMIXED EVIL.

In North Lansing, Mich., "much dissatisfaction was developed" at many of the best wells within a block of the newly constructed sewers going dry, in consequence of the underdrainage of the soil by the sewers. As the water had previously stood within two feet of the ground, it seems as if the injury to the water supply would be more than compensated by the removal of the surplus water in the soil, not to speak of the cellars, which the sewers must effect.

The systematic inspection of waste in houses has produced excellent results in Cincinnati during the past year. The amount of water pumped has been actually less than in 1879, 1880, or 1881, and the saving in coal over last year has been 4,000 tons. The fact seems to be that the Cincinnati officials are not wild to build a new engine, or a new reservoir, or an aqueduct, or something, and besides, they have stop cocks on the service pipes at the edge of the sidewalk, so that in the night watches they can listen and discover whether water is being wasted, instead of being obliged to creep into sewers, as the New York waste inspectors do, in the spasmodic examinations they make.

SUPPOSED SUBTERRANEAN DRAINAGE OF THE INTERIOR OF AUSTRALIA.—In a paper in the *Journal* of the Royal Society of N. S. Wales, Vol. XV., 1882, entitled, "Notes of a Journey on the Darling," by Mr. W. E. Abbott, the author refers to the observations of Mr. Russell, which seem to prove that the amount of water received by precipitation over the water-shed of the Darling much exceeds that which is carried off by the Darling and by evaporation, and he inclines to the opinion expressed by Mr. Russell, that there is an underground drainage system wholly distinct and different in direction from the surface drainage. The underground water would probably take a course to the southwest, and he suggests that this may have been the course of a more ancient river system. Some evidence with regard to such subterranean waters is presented from wells which have been sunk in the vicinity of the Darling, and whose flow seems to be independent of variations in that river.—*Mining and Scientific Press.*

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to December 1, 1882.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending Dec. 23 of a municipal population of 6,566,957 there died 2,733, corresponding to an annual mortality of 21.6 per 1,000. This is less than the rate for the preceding week, which was 22.3 and less than that of any of the groups of European cities reported. Diphtheria continues unusually prevalent in Boston, Philadelphia, St. Louis and Detroit. A large part of the deaths reported as due to croup, should no doubt be charged to diphtheria. Scarlet fever caused a relatively large number of deaths in Cincinnati. The mortality is lowest among the southern whites, and in the Lake Cities, but among these last Buffalo and Cleveland are not reported. Pneumonia caused 11.4 per cent. of all the deaths as against 9.7 per cent. for the preceding week.

LOUISVILLE, KY.—Dr. E. R. Montgomery reports that eight cases of small-pox caused five deaths in hospital and one death outside the city limits.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 14 new cases of scarlet fever and six of diphtheria with 35 of the former disease and 11 of the latter carried forward from last week.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports eight admissions, 12 discharges and one death, leaving 1,334 insane under treatment.

INDIANAPOLIS, IND.—Dr. E. S. Elder reports scarlet fever as decreasing.

BOSTON, MASS.—C. E. Davis, Jr., reports 51 cases of diphtheria, 27 of scarlet fever and 19 of typhoid fever.

The Providence *Journal* of Dec. 18, in commenting on the prevalence of typhoid fever in that city, refers to Boston as having had 8,527 cases of the disease *during the last four months*. The cases reported to the Boston Board of Health are as follows: August, 60; September, 216; October, 173; November, 91. Total during the four months, 530 cases.

DAYTON, OHIO.—Dr. E. B. Davis reports the occurrence of three cases of small-pox.

ROCHESTER, N. Y.—Dr. Wm. F. Sheehan reports that the Health Board has had the manholes of the sewers freed from ice and snow.

Digitized by Google

and that the deaths from diphtheria have diminished 50 per cent. as compared with the previous week.

PITTSBURGH, PA.—Dr. Snively reports two new cases of small-pox.

ROCK ISLAND, ILL.—Dr. G. G. Craig, Commissioner of Health, reports five deaths during the two weeks ending December 16. There are no zymotic diseases.

BALTIMORE, MD.—There were 226 deaths in Baltimore during the week. Of these 113 were males and 113 females; 86 were under five years. The annual rate calculated on the police census was 28.73. Small-pox gives the largest death record, it having caused no less than 57 deaths. Diphtheria caused 19 deaths, croup six, consumption 24, and pneumonia 11.

PROVIDENCE, R. I.—Dr. E. M. Snow notes the increased mortality during the present week as one of those accidental variations which occur in the weekly mortality of a city of the size of Providence, or any smaller city where the variation is so great in proportion to the whole number of deaths that it seems much more important than it really is. On account of this variation weekly reports from any small city are misleading and deceptive if used as a standard for the true rate of mortality or for comparison with the mortality of other places.

MICHIGAN.—Dr. H. B. Baker reports the following diseases in their order of prevalence in the State during the week: bronchitis, neuralgia, rheumatism, tonsilitis, intermittent fever, consumption, influenza and pneumonia. The last case of small-pox was discharged from hospital at Grand Rapids, December 14.

PERNAMBUCO, BRAZIL.—Consul Atherton reports the small-pox as declining; only four deaths were caused by it during the week ending November 19.

RIO DE JANEIRO.—Deputy Consul General Murray reports the health of the city as fair but for the presence of small-pox. The deaths for the week ending November 25 numbered 226, of which 41 were caused by small-pox and 37 by consumption.

AUX CAYES, HAITI.—Vice-Consul Th. Dutton reports 18 deaths from small-pox during the five weeks ending December 2.

PORT AU PRINCE, HAITI.—Consul J. M. Langston under date of December 5, reports that rumors of small-pox are prevalent, but the disease has not been officially acknowledged by the sanitary authorities.

ENGLAND.—The return of the *Registrar General* for the week ending Dec. 9, shows an average death rate in the 28 large towns of 23.4 per 1,000. The smallest rate was in Derby, 16.2; the largest in Sunderland, 35.5; in London the rate was 22.4. An abstract of the return is given in our weekly table.

SCOTLAND.—Consul J. A. Leonard, Edinburgh, transmits the return of the *Registrar General* for the week ending Dec. 9. The average death rate in the eight principal towns was high, 28.0 per 1,000. This rate is 6.4 above that for the corresponding week of last year and 3.2 above that for the previous week of the present year. The lowest mortality was recorded in Edinburgh, 21.9, and the highest in Perth, 37.8 per 1,000. From acute diseases of the chest 185 deaths were reported, or 46 more than in the previous week. For an abstract of the return see table given above.

IRELAND.—Consul A. B. Wood, of Belfast, sends the *Registrar General's* return for the week ending Dec. 9. An abstract is given in our statistical table.

PARIS, FRANCE.—During the week ending Nov. 29, there were 1,064 deaths, males 573, females 491; equaling an annual mortality rate of 24.71. Typhoid fever caused 73 deaths, small-pox 11, measles eight, scarlet fever two, whooping cough two, diphtheria 32, consumption 212, pneumonia and bronchitis 107, and violence 31 deaths. During the week ending Dec. 6 there were 1,135 deaths: males 593, females 542. Annual rate 26.34. Deaths from typhoid fever and consumption decreased in number; those from acute lung affections increased.

BRUSSELS, BELGIUM.—During the week ending Dec. 2 there were 181 deaths, equal to an annual rate of 23.0 per 1,000. Diarrhœal diseases caused 17 deaths, acute lung affections 34, consumption 24. Zymotic diseases did not contribute much to the mortality, as there were but four deaths from croup, two each from typhoid and scarlet fevers and one each from small-pox and measles.

RHEIMS, FRANCE.—Consul Jno. L. Frisbie reports 34 deaths during the week ending Dec. 4. Croup caused two deaths, measles one, and small-pox one.

ST. PETERSBURGH, RUSSIA.—Consul General Edgar Stanton reports 589 deaths during the week ending Nov. 25, 282 of which were under five years. Small-pox caused 33 deaths, and typhoid fever 24; diphtheria and scarlet fever are said to be prevailing. During the ten months ending Oct. 31, there were recorded 2,217 cases of diphtheria, of which 1,066 proved fatal. A mortality of 47.1 per cent.

SPAIN.—The Spanish Monthly *Bulletin* for September shows the occurrence of 34,507 deaths in a population of 16,847,580, this being equal to a mortality rate of 2.048 per 1,000; the corresponding birth rate having been 2,139.

Of the decedents 19,160 were under five years and 5,352 over 60 years. Small-pox caused 1,416 deaths, measles 1,191, scarlet fever 165, diphtheria and croup 817, typhoid fever 450, typhus fever 409, dysentery 1,563, puerperal fever 505, malarial fevers 480, consumption 1,509, acute diseases of the lungs 2,488, and accidents and violence 390.

VIENNA, AUSTRIA.—Consul General Weaver reports 342 deaths during the week ending Dec. 2. Rate 24.0. Birth rate 37.0. Small-pox caused six deaths, measles one, scarlet fever three, diphtheria three, whooping-cough six, typhoid fever four and consumption 61 deaths.

MONTHLY REPORTS FOR NOVEMBER.

BOSTON, MASS.—Samuel H. Durgin, Chairman Board of Health. Deaths 697; rate 20.3; males 333, females 364; under 5 years 193; accidents, etc., 35; cerebro-spinal meningitis 1, consumption 149, croup 15, diarrhœal diseases 25, diphtheria 48, erysipelas 2, typhoid 19, scarlet fever 8, pneumonia 60, bronchitis 24, puerperal fever 5, whooping-cough 4; no deaths from measles or small-pox. Cases reported during the month, diphtheria 188, scarlet fever 102, typhoid fever 92.

LOWELL, MASS.—Office Board of Health, City Hall. Deaths 80; of 29 distinct diseases reported as causing death, 18 caused only one death each. Consumption caused 18 deaths and pneumonia 8. There is only one death from contagious diseases, whooping cough.

NEW HAVEN, CONN.—C. A. Lindsley, M.D., Health Officer. Deaths 85; males 49, females 36; under 5 years 27, over 60 years 16; annual rate 14.6. Consumption 18, diphtheria and croup 9, typhoid fever 4, malarial fevers 4, scarlet fever 1, pneumonia 6, bronchitis 3, and puerperal diseases 1. No deaths from small-pox or measles.

PROVIDENCE, R. I.—Edwin M. Snow, Supt. of Health. Deaths 247; males 118, females 129; white 235, colored 12; under 5 years 46, over 60 years 45. Accidents, etc., 9, consumption 24, croup 8, diarrhœal diseases 6, diphtheria 7, typhoid fever 70, malarial fevers 2, scarlet fever 1, pneumonia 19, bronchitis 8, puerperal diseases 2 and whooping cough 2. The progress of the typhoid fever epidemic has been already noted in our weekly notes.

PATERSON, N. J.—George Boyd, Registrar. Deaths 100; population 55,000; males 53, females 47; under 5 years 35, over 60 years 16; accidents 3, consumption 16, croup 4, diarrhœal diseases 1, diphtheria 3, scarlet fever 1, pneumonia and bronchitis 7, small-pox 6.

HUDSON CO., N. J.—C. J. Rooney, Jr. Deaths 330; births 438; still-births 34; mortality rate 19.1; deaths under 5 years 152; accidents 13, cerebro-spinal fever 1, consumption 40, croup 13, diarrhœa 3, diphtheria 19, typhoid fever 5, malarial fever 1, scarlet fever 9, puerperal fever 2, pneumonia 42, congestion of lungs 5, bronchitis 14, measles 11, whooping cough 2; no deaths from small-pox are recorded.

SCRANTON, PA.—T. P. O'Malley, Secretary. Deaths 40; males 23, females 17; under 5 years 9, over 60 years 9. The report does not show the population or annual rate. Violence 6, consumption 2, croup 1, diarrhœa 2, diphtheria 2, typhoid fever 1, pneumonia 2, bronchitis 1, and whooping cough 1; no deaths from measles, small-pox or scarlet fever. Births 75, males 43, females 32.

TOLEDO, OHIO.—C. L. Van Pelt, Health Officer. Deaths 53; males 28, females 24, unknown 1; under 5 years 19, over 60 years 7; violent deaths 5, consumption 7, croup 1, diarrhœa 1, diphtheria 9, typhoid fever 2, pneumonia 1, congestion of lungs 2, bronchitis 2, and puerperal diseases 1. Annual mortality rate for the month 10.6 per 1,000.

CHICAGO, ILL.—Oscar C. DeWolf, Commissioner of Health. Deaths, 811; stillbirths, 69; mortality rate, 17.36; male decedents, 442; female, 369; under five years, 347; over 60 years, 102; five of whom were over 90 and one over 100 years. Accidents, etc., 44, consumption 65, croup 22, diarrhœal diseases 11, diphtheria 53, erysipelas four, typhoid fever 38, malarial fevers nine, scarlet fever 37, pneumonia 61, congestion of lungs eight, bronchitis 39, pleurisy 1, measles three, puerperal diseases 11, small-pox 14, and whooping cough six.

ST. PAUL, MINN.—C. A. Wheaton, Health Officer. Deaths, 109; males 68, females 29, but these do not sum the total of 109. Under five years, 42; over 60 years, 12. Accidents eight, cerebro-spinal meningitis two, consumption nine, croup five, diarrhœal diseases one, diphtheria 15. erysipelas one, typhoid fever 18, pneumonia three, congestion of lungs one, bronchitis two, whooping cough one. No deaths from measles or small-pox.

MINNEAPOLIS, MINN.—J. C. Cockburn, M. D., Health Officer. Deaths, 120; rate 18.0; males 61, females 59. Under five years, 45; over 60 years, eight. Accidents two, cerebro-spinal fever two, consumption eight, croup three, diarrhœa one, diphtheria 25, pneumonia seven, congestion of lungs four, typhoid fever 24, small-pox one, puerperal fever two. No deaths are recorded from measles, scarlet fever, or whooping cough.

DETROIT, MICH.—O. W. Wight, M.D., Health Officer. Deaths, 241; rate, 23.45; males 121, females 120 Under five years, 93; over 60 years, 25. Accidents three, croup 15, consumption 19, diarrhœal diseases two, diphtheria 49, erysipelas one, typhoid fever three, malarial fevers eight, scarlet fever 24, pneumonia eight, congestion of lungs one, bronchitis 10, and puerperal diseases four. No deaths recorded from small-pox, measles, or whooping cough.

BURLINGTON, IOWA.—S. H. Stutsman, City Physician. Deaths 24; population, 27,000; males 10, females 14. Under five years, eight, over 60 years, two. Accidents two, consumption three, typhoid fever three, croup one, pneumonia two. No deaths from scarlet fever, measles, small-pox, diphtheria, or whooping cough.

MILWAUKEE, WIS.—R. Martin, M. D., Commissioner of Health. Deaths, 186; rate, 17.9; males 90, females 96. Under five years, 89; over 60 years, 23. Accidents eight, cerebro-spinal fever four, consumption 14, croup seven, diarrhœa two, diphtheria 15, typhoid fever three, typhus fever one, scarlet fever four, pneumonia 11, congestion of lungs two, bronchitis eight, whooping cough one, and puerperal diseases four. No deaths from small-pox or measles.

KEOKUK, IOWA.—Geo. F. Jenkins, President Board of Health. Deaths, 18; population, 15,000; male decedents, nine; females, nine; under five years, seven; over 60 years, four; consumption, three; typhoid fever, two; croup, one; pneumonia, one No diphtheria, measles, small-pox, scarlet fever, or whooping cough.

DISTRICT OF COLUMBIA.—Smith Townshend, M. D. Health Officer. Births, 238; white males, 67; females, 79; colored males, 45; females 46; unknown sex and color, one. One case of triplets and four cases twins reported. Deaths, 316; rate 20.05; white males, 82; females, 80; colored males, 72; females, 82. Annual rate for white people, 15.58; for colored, 28.69. Accidents, etc., 6, consumption 59, croup one, diarrhœal diseases 13, diphtheria 17, erysipelas one, typhoid fever six, malarial fevers nine, scarlet fever eight, pneumonia 28, congestion of lungs two, bronchitis nine, pleurisy one, puerperal diseases, two and whooping cough one. No deaths from measles or small-pox.

RICHMOND, VA.—J. G. Cabell, President Board of Health. Deaths, 122; white males 32, females 23, colored males 36, females 31; under five years 46, over 60 years 20. Rate 21.52. Casualties four, cerebro-spinal meningitis one, consumption 16, croup one, diarrhœal diseases three, diphtheria two, typhoid fever two, malarial fever one, pneumonia seven, and puerperal fever two.

NORFOLK, VA.—Jas. D. Galb, M. D., Health Officer. Deaths 44; white males seven, females seven; colored males 13, females 17; under five years, white seven, colored 15; over 60 years, white one, colored five; accidents two, cerebro-spinal fever one, consumption four, croup three, diarrhœa three, diphtheria two, typhoid fever one, malarial fevers two, pneumonia four. No scarlet fever, measles or small-pox. The report is deficient in giving neither the rate nor the population.

NASHVILLE, TENN.—Richard Chatham, M.D., Health Officer. Deaths, 91; white males 22, females 29; colored males 16, females 24; annual rate 23.66, for white people 20.91, for colored 30.00; under five years 31; over 60 years 18; accidents six, consumption 14, croup two, diarrhœa two, diphtheria one, erysipelas one, typhoid fever one, malarial fever four, pneumonia five, and pleurisy one. No deaths from measles, scarlet fever, small-pox or whooping cough.

MOBILE, ALA.—E. H. Fournier, Health Officer. Death 87; white males, 18; females, 22; colored males, 27; females, 20; under five years 25, over 60 years 10. Average death rate per 1,000 for the month 2.77. Consumption, eight; croup, three; diphtheria, two; dysentery, two; typhoid fever, four; malarial fevers, seven; pneumonia, two; congestion of the lungs, two; bronchitis, one. No deaths from measles, scarlet fever, small-pox or whooping cough.

CALIFORNIA.—F. W. Hatch, Sec. State Board of Health. Twenty-two localities reporting give a total of 637 deaths. Of the towns heard from four are near the coast, three in the coast valleys, ten in the interior valley and five in the mountains. Taken together they embrace nearly half the population of the State. Annual rate 19.14. Dr. W. C. Jones reports typhoid and typho-malarial fevers as prevailing in Nevada County, and Dr. C. W. Evans sends a similar report with regard to Moderto in the San Joaquin Valley. Diphtheria and scarlet fever are increasing. Seventy-eight deaths were due to acute lung diseases, and they are reported as more or less prevalent from all the localities heard from.

SAN FRANCISCO, CAL.—J. L. Meares, M.D., Health Officer. Deaths, 400; males, 265, females, 135; under five years, 96, over 60 years 46; population 234,520. Accidents, etc., 20; consumption, 70; croup, four; diarrhœa and dysentery, seven; diphtheria, 14; erysipelas, one; typhoid fever, 17; malarial fever, three; scarlet fever, two; pneumonia, 26; congestion of lungs, four; bronchitis, 11 and puerperal diseases, three. No deaths from measles, whooping cough or small-pox.

Tables showing number of new patients at six New York City dispensaries for the week ending December 16, 1882, with some of the principal acute diseases.

Name of Dispensary and Reporter.	Character of Disease.	Monday.	Tuesday.	Wednesday.	Thursday.	Friday.	Saturday.	Total.

*Sex not given.

During the week ending December 16, 1,120 cases of acute disease received attention, an increase over the preceding week, the number for which was 898. The prevailing diseases are those of the lungs; the proportion of cases reported as malarial fevers is high for the time of year. Eleven cases of measles, six of diphtheria and one of typhoid are reported.

Patents.

It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

264,788. STEAM TRAP. GEORGE S. STRONG, Philadelphia, Pa., Filed July 31, 1882. (No model.) Issued Sept. 19, 1882.

Claim.—1. The combination of the lever M with a valve stem or block, J, having a slot, *m*, with transverse bearing pins, *n*, as set forth.

2. The combination of the casing of the trap, the expansion tube H and its slotted block J, the balanced valve F, having a slotted stem, *d*, and the lever M, adapted to the slots of the valve stem and block J, as set forth.

3. The combination of the casing of the trap, the expansion tube H threaded at the upper end, the nut *k*, and the flanged sleeve *h*, having an internal thread adapted to that on the tube H, and an external thread for the reception of the nut *k*, as set forth.

264,702. ROTARY WATER METER. JONATHAN JOHNSON, Lowell, Mass. Filed March 7, 1882. (No model.) Issued Sept. 19, 1882.

Claim.—1. A fluid meter provided with a bladed wheel gearing with the registering mechanism, with two or more independent passages of different sizes for intersecting streams of water upon said wheel, and valves controlling the flow of water in the larger passage only, and an automatic device whereby the said larger passage is opened in proportion to the amount of water required, substantially as set forth.

The combination, with a fluid meter provided with registering mechanism and a driving wheel actuated by the passage of fluid through the meter, of a supplemental tube, affording a passage for a small stream, whereby the wheel is revolved when the main passage is closed, for the purpose set forth.

3. The combination in a meter, with one or more valves controlling the main fluid passage, of a regulating device communicating with the chambers connected by such passage, and provided with a piston and with openings whereby the pressure of fluid in the two chambers is brought upon opposite sides of the piston, for the purpose set forth.

4. The combination in a meter, of registering devices operated by a stream flowing through the meter, a valve controlling the said stream and an independent regulating device connected to said valve and constructed to be operated by the varying pressure in the meter, as set forth.

5. The combination of the valves E, controlling the main fluid passages and the cylinder, piston, and ports by which communications are established between the opposite ends of the cylinder and the chambers connected by said passages, and a weighted lever connected to the valves and piston, substantially as set forth.

6. The combination in a fluid meter, of the valve regulating the flow of fluid between the chambers connected by the main passages, an operating wheel, C, and an independent tube, J, connecting the chambers, substantially as set forth.

7. The combination with the tubes through which the operating streams are injected upon the register operating wheel, of the adjustable nozzles and devices extending to the outside of the case and constructed to move said nozzles, substantially as described.

8. The case A^2, provided with a hollow stud, P, in combination with the perforated case A^4, packing *w*, arranged between a shoulder on the stud and the top of the case A^4, and screw cap and packing upon the upper end of the stud, all in combination with the spindle N, driving wheel and train, and registering devices, as specified.

264,715. COMPRESSION COCK. ROBERT H. LECKY, Allegheny, Pa. Filed May 8, 1882. (No model.) Issued Sept. 19, 1882.

Claim.—1. In a compression cock, an axially reciprocating valve and an adjustably fixed fulcrum, in combination with two toggle levers interposed between and pivoted to said fulcrum and valve or valve stem, the pivotal points of connection of said toggles to the said valve and fulcrum being on the axis of movement of said valve, and suitable means of operating either of said toggle levers, substantially as described.

2. In a compression cock, the combination of a reciprocating valve, *c*, having stem *d*, stem-guide C, independent pin *g*, and the toggles *m n*, interposed and forming the sole connection between said stem *d* and pin *g*, substantially as described.

3. In a compression cock, the combination with the reciprocating valve *c*, having stem *d*, of the toggles *m n*, pin *g*, having collar K, stem-guide C, spring *i*, and adjustable cap nut *l*, substantially as described.

4. In a compression cock the combination with the pin *g* and valve stem *d*, of the abutting toggles *m n*, toggle *m* having the shoulder or abutment *o*, and toggle *n* having the handle *p*.

5. In a compression cock the combination of the post C, having radial slots *f*, with valve stem *d*, toggles *m n*, a fixed fulcrum for said toggles, and a projecting handle, *p*, substantially as described.

6. In a compression cock, the combination of bib A, post C, having flange *c*, cap *b*, valve stem *d*, valve *e*, washer *r*, and spring *s*, substantially as described, with suitable means for reciprocating said valve stem.

264,895. STEAM TRAP. JAMES PARK, Troy, N. Y., assignor to John L. Russell and Charles Corlies, both of same place. Filed Mar. 13, 1882. (No model.) Issued September 26, 1882.

Claim.—1. The combination, in a steam-trap, of an inner perforated tube firmly secured to the trap-base in direct communication with the trap-inlet at its lower end, and its upper closed end projected through a stuffing-box in the trap-cap, and a lever having a pivoted fulcrum with its short arm pivoted to the projected closed end of the perforated tube, and its long arm pivoted to the stem of a discharge-valve arranged upon the trap egress-opening, whereby the valve-opening is closed by the expansion of the inner tube.

2. In combination a steam-trap consisting of the exterior cylinder, A, offset-pipe T, inner perforated tube, C, secured to the base of the trap at one end and in direct communication with the trap inlet, the stuffing-box *b*, cap D, lever L, fulcrum F, valve-rod M, and valve V, constructed and arranged to close the valve by the expansion of the tube, as herein shown and described.

264,914. PIPE COUPLING. WILLIAM H. WARD, Pittsburgh, Pa. Filed Mar. 18, 1882. (No model.) Issued September 26, 1882.

Claim.—1. The combination, with the separate fixed supply pipes *a a* and the ball-and-socket-joint pipe-sections *m m*, of the sleeve *o*, carried by one of said pipe-sections and made extensible thereon to envelop and support the other pipe section after the cars have been coupled, substantially as described.

2. The combination, with the supply-pipes *a*, of the joint pipe sections *m m*, the sliding sleeve *o*, and the fixed jacket *r*, substantially as described, for the purpose specified.

3. The combination of the separate fixed supply-pipes *a a*, the ball and socket-joint pipe-sections *m m*, and the sleeve *o*, extensible upon one of said pipe-sections, with the catches *q q*, carried by said extensible sleeve, substantially as described, for the purpose specified.

4. In combination, the supply-pipes *a*, the joint pipe-sections *m m*, the sliding sleeve *o*, the catches *q q*, and the fixed jacket *r*, the said sleeve being carried by one of said pipe sections, and the said jacket being fixed to the supply-pipe and enveloping the said sleeve-carrying pipe-section, substantially as described, for the purpose specified.

264,920. DOMESTIC GARBAGE-BURNER. AGRIPPA N. BELL, Garden City, N. Y. Filed Feb. 12, 1881. (No model.) Issued September 26, 1882.

Claim.—1. In a garbage burner, the combination, with the kettle O, having an aperture in the base for the admission of the flame and heat, of the straining-pail C and dumping-bottom, substantially as set forth.

2. The combination of the kettle O, cover A, base-aperture, and inserted-ring P, extending both inside and outside of the bottom, forming a stove ring on the outside and partitioning off the liquid chamber *v* on the inside, with the perforated conical pail C and removable or dumping bottom, substantially as set forth.

3. The kettle O, provided with the chamber *v* and drip-chamber B, in combination with the cover A, having the lip *a* inserted in the drip-chamber B, and with the strainer C, provided with a dumbing-bottom, substantially as set forth.

4. In a garbage-burner of the kind described, the combination, with the kettle O, having suitable supporting means for the dumping-frame D D^1, dumping wings E E, shafts H G and connecting-levers F *f g*, as set forth.

5. The kettle O, provided with the ring P, in combination with the pail C and dumping-bottom, as set forth.

6. The garbage-burner described, consisting of the kettle O, provided with pan B and ring P, in combination with pail C, *x* and dumping-bottom E D D^1 F *f g* G H, as set forth.

264,918. SELF-LUMINOUS PAINT. WILLIAM H. BALMAIN, Eversley, Ventor, County of Hants, Isle of Wight, England; Harriet Fox, executrix of said William H. Halmain, deceased. Filed Nov. 20, 1878. Patented in England Nov. 7, 1877, No. 4,152; in Victoria Dec. 31, 1879, No. 2,766; in Italy Dec. 31, 1880, XXV, 131; in Belgium Jan. 3, 1881, No. 53,483; in Tasmania Mar. 21, 1881, No. 192; in New Zealand Apr. 28, 1881, No. 523; in Spain, May 21, 1881, No. 1,455; in Sweden June 18, 1881; in New South Wales June 26, 1881, No. 947; in Queensland July 12, 1881, No. 354; in Portugal July 21, 1881, No. 688, and in Austria Dec. 7, 1881, No. 33,137. Issued September 26, 1882.

Claim.—A luminous paint the body of which is a phosphorescent substance or composed in part of such substance, the vehicle of which is such as is ordinarily used in paints—viz., one which will become dry by oxidation or evaporation—substantially as herein described.

264,936. MANIFOLD PIPE-JOINT. WILLIAM W. DOOLITTLE, Chicago, Ill. Filed June 12, 1882. (No model.) Issued September 26, 1882.

Claim.—In combination with a main pipe, A, and a branch pipe, B, a ring, C, packing-ring *a*, gland D, and a clamping device, all substantially as and for the purpose specified.

264,649. DYNAMO OR MAGNETO ELECTRIC MACHINE. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed March 20, 1880. (No model.) Patented in England April 5, 1880, No. 1,385; in Canada Oct. 9, 1880, No. 11,857; in Italy Oct. 12, 1880; in Belgium Oct. 15, 1880, No. 52,698; in Victoria Nov. 17, 1880, No. 2,026; in France Nov. 27, 1880, No. 138,941; in Austria Dec. 24, 1880; in New South Wales Jan. 19, 1881. in Queensland Feb. 7, 1881; in Spain Feb. 21, 1881; in New Zealand March 7, 1881, No. 511; in Portugal March 31, 1881, No. 660, and in India April 12, 1881, No. 278. Issued Sept. 19, 1882.

264,650. MANUFACTURE OF INCANDESCING ELECTRIC LAMPS. THOMAS A. EDISON, Menlo Park, N. J. Filed Dec. 9, 1881. Renewed Aug. 14, 1282. (No model.) Issued Sept. 19, 1882.

264,651. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 7, 1882. (No model.) Issued Sept. 19, 1882.

264,652. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 7, 1882. (No model.) Issued Sept. 19, 1882.

264,653. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 7, 1882. (No. model.) Issued Sept. 19, 1882.

264,654. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 7, 1882. (No. model.) Issued Sept. 19, 1882.

264,655. INCANDESCING ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 7, 1882. (No model. Patented in England Sept. 27, 1881, No. 4,174; in Italy Nov. 9 1881; in France Dec. 5, 1881, No. 145,554; in Canada Dec. 14, 1881, No. 13,835, and in India Jan. 18, 1882, No. 74.

264,656. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 14, 1882. (No model.) Issued Sept. 19, 1882.

264,657. INCANDESCENT ELECTRIC LAMP. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Aug. 30, 1881. (No model.) Issued Sept. 19, 1882.

264,658 to 264,673. REGULATORS FOR DYNAMO-ELECTRIC MACHINES. THOMAS A. EDISON, Menlo Park, N. J. Filed Aug. 7, 1882. (No model.) Issued Sept. 19, 1882.

264,660. REGULATOR FOR DYNAMO-ELECTRIC MACHINES. THOMAS A. EDISON, Menlo, Park, N. J. Filed Aug. 7, 1882. (No model.) Issued Sept. 19, 1882.

264,737. INCANDESCING ELECTRIC LAMP. SAMUEL D. MOTT, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Nov. 29, 1882. (No model.) Issued Sept. 19, 1882.

264,858. STOVE GRATE. ESEK BUSSEY, Troy, N. Y. Filed July 5, 1882. (No model.) Issued September 26, 1882.

264,863. BLOWER FOR FIRE PLACES. BENJAMIN G. COVINGTON, Fort Mill, S. C. Filed May 9, 1882. (No model.) Issued September 26, 1882.

264,866. OIL STOVE. ALFRED S. DINSMORE, Boston, Mass. Filed July 31, 1882. (No model.) Issued September 26, 1882.

264,866. CARPENTER'S VISE. AMOS FALES, Denver, Colo. Filed Apr. 22, 1882. (No model.) Issued September 26, 1882.

264,870 FILTERING APPARATUS. ALLEN FISKE, Portland, Me., assignor of one-fourth to Septimus L. Fisk, Boston, Mass. Filed May 1, 1882. (No model.) Issued September 26, 1882.

The Board of Health of Boston has issued the following order:

WHEREAS, the diseases designated as small-pox, scarlet fever, diphtheria, and typhus fever are contagious and dangerous to the public health, and have been, and may easily be contracted at funerals from dead bodies or apartments which have been infected by such diseases, it is therefore ordered that from and after this date, no public funeral shall be held over the remains of any person having died of small-pox, scarlet fever, diphtheria, or typhus fever, without the written permit of the Board of Health; and under such regulations as may prevent the spread of either of said diseases.

Ordered, further, that the remains of persons dying of either of said diseases shall at once be placed in a tight or sealed coffin, and shall not thereafter be exposed to view or disturbed except for burial.

Extract from Carriage Ordinances of the City of Boston.

"SEC. 24. No owner, driver, or other person having charge of any hackney carriage or other vehicle used as a public conveyance, shall receive, or permit to be placed, or convey in any manner, in or upon said carriage or other vehicle, any person sick or infected with the small-pox or any other contagious disease, or the body of any person who has died of small-pox or any other contagious disease, under penalty of forfeiture of his license."

The Board of Health directs special attention to small-pox, scarlet fever, diphtheria, and typhus fever as being contagious, dangerous to the public health and within the meaning of the above ordinance.

Published by order of the Board of Health,
SAMUEL H. DURGIN, M. D., *Chairman.*

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,
106 WALL STREET, NEW YORK.

THE undersigned respectfully announces that on January 1st, he will begin practice as

Consulting Mechanical Engineer.

at 96 Fulton St., his specialty being Steam Heating and Ventilation. The experience acquired during 20 years' practice, is at the service of those who may employ him. In the matter of preparing plans and specifications for Steam work, and advising on the respective merits of proposed plans, he hopes to be useful to owners, architects, and users of steam. Very respectfully,

AUTHOR WM. J. BALDWIN.
"*Steam Heating for Buildings.*" Mem. Soc. Mech. Eng.

A valuable holiday present for a faithful employee: the fifth and sixth volumes of THE SANITARY ENGINEER, bound in cloth, or either of them.

If he reads them to any purpose he will be more useful, and your present will increase in value as it grows older.

5th Vol. $4.00. 6th Vol. $3.00.

Pure Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

A SOUND POLICY.

PURE SPICES ONLY.

Some manufacturers and dealers allege that it is necessary to give a large weight or bulk for a certain amount of money, hence the admixture of many worthless, if not hurtful, compounds. Now we do not believe in this argument, and while there may be some demand for "a big package for a small amount of money," we rate the intelligence of the American people too high to believe that they prefer to have half a pound of adulterated spice instead of a quarter of a pound of pure spice containing the same strength. As well might the consumer prefer a quart of water mixed with an equal quantity of milk at a higher price for the two quarts of mixture than for the one quart of milk. We therefore put up

PURE SPICES ONLY,

and leave it to others to furnish adulterated spices, if any are required. We some time since dropped from our list the Griswold's O K and I X L brands, retaining the "*Thurber's S. I.,*" and "*Massasoit Mills*" brands, the former being an extra grade of the finest, freshest and strongest spices, especially Selected and Imported, hence the brand (S. I.), for the finest trade; while the "*Massasoit*" brand will represent strictly pure goods of good quality. Both of these brands will be put up *full weight*, thus heading off another swindle frequently perpetrated upon the consumer, and to meet the demand which may legitimately exist for a package of spice for a small amount of money, we have concluded to put up, in addition to the larger size, *a two-ounce round tin, with sifting top*, which we guarantee contains more real value than the usual four-ounce tin of adulterated spices, the only condition necessary in the use of pure spices being to use less of them.

We expect that consumers will, and, indeed, they have, sustained us in taking this stand. Reputable dealers prefer to sell only full weight and genuine goods. Competition from the unscrupulous sometimes induces them to keep good, bad, and indifferent. We rely on the intelligence of consumers to encourage them to keep first-class articles. Ask therefore for

Thurber's S. I. Spices.

They are put up in two, four, eight and sixteen-ounce tins. *Always full weight.*

A Valuable Book of Reference.

THE FIFTH VOLUME OF
THE SANITARY ENGINEER,
OF NEW YORK,
Includes the twenty-six weekly issues from December 1st, 1881, *to May 25th,* 1882.

A complete record of all United States Patents for fixtures and appliances used in plumbing, sewerage, gas fitting, gas manufacture, steam and hot water heating, ventilation, and electric lighting, makes it valuable to inventors and manufacturers.

The following are a few of the many articles of permanent interest:

A review of town sewering in England, with opinions on the question of small *versus* large sewers, or the combined *versus* the separate systems, by Robert Rawlinson, C.B, Chief Engineer, Inspector Local Government Board, England.

A report on the Sewerage of Concord, by Edw. S. Philbrick, C.E., instructive to town authorities generally.

Remarks by John S. Billings, Surgeon, U. S. Army, before the Academy of Medicine, New York, on sewer gas and the value of modern methods for excluding it from houses. This article throws considerable light on a question generally misunderstood.

Electric Lighting; its Fire Risks and their Remedies. Two articles by Prof. Henry Morton, President Stevens' Institute of Technology, Hoboken, New Jersey,

Illustrations, with description of the Arrangements for Heating and Ventilating the Bridgeport School House (intended to be a model building).

A continuation of Dr. J. S. Billings' Letters to a Young Architect on Ventilation and Heating, with illustrations of notable buildings.

A continuation of the "Sanitas" articles on Plumbing Practice (illustrated). Interesting to architects, builders, and plumbers.

Steam Fitting and Steam Heating, by "Thermus," a series of practical articles (illustrated), of great value to steam fitters and architects.

Illustrated Descriptions of notable jobs of Plumbing Heating, and Ventilating in Private Residences in the United States, including those of Mr. W. H. Vanderbilt and Mr. R. H. Bishop, of New York.

A series of articles on Petroleum Legislation in the United States, by E. G. Love, Ph. D.

A Report to the Greenock Board of Police on the Ventilation of the Sewers of Thirty-three Towns in England, compiled from information received from City Engineers, by Alex. J. Turnbull, C.E. Valuable to engineers and health officers.

A series of carefully prepared editorials on the Water Supply of New York, discussing the various schemes proposed for increasing it; also the measures to prevent waste. Opinions of prominent English engineers on the practice in England, and suggestions for American adoption, in connection with a controversy over the rules of the New York authorities with regard to the manner of flushing water closets. The letters and articles on the question of Valve *versus* Direct Supply to Water Closets are of great interest to manufacturers, plumbers, health officials and water works engineers.

Reports on Adulteration of Food and Drugs in the State of New York, being full abstracts of the reports of Professor Chas. F. Chandler, on Milk (fresh and condensed); Prof. G. C. Cornwell, on Butter (dairy and artificial), Cheese, Lard, Olive Oil, and Fruit Essences; by Professor A. H. Chester, on Canned Meats and Animal Foods; by Dr. E. G. Love, Ph.D., Cereals and the Products and Accessories of Flour, Special Artificial Foods for Infants and Idvalids, Baking Powders, Cream Tartars, Alum Powders and the "Alum Question;" by Professor A. S. Lattimore, on Canned Fruits and Vegetables, Vinegar Spices, etc.; W. H. Pitt, M.D., on Sugars, Glucose, etc.; J. E. Englehardt, Ph.D., on Wines, Beers, Spirits and Cordials; by J. Hoffman, Ph.D., on Crude Vegetable and Animal Drugs, Pharmaceutical Chemicals and their preparations; by Professor Caldwell, on Quinine Pills and Capsules; by W. G. Tucker, M.D., on Citrate of Magnesia and Seidlitz Powders.

These reports are on examinations made under the direction of the New York State Board of Health with a view of ascertaining the condition of the Food and Drug supply in the State, and the extent and charaeter of the adulterations practiced. They are valuable to health officials, analysts, and manufacturers.

Notes upon some Prosecutions in Great Britain under the Food and Drugs Act, by Alfred Senier, M.D., F.C.S.

Paris Street Cleaning, by James Tallmadge Van Rensselaer. An elaborate and full account of the system and the cost of its maintenance—of value to city authorities.

Washington Drainage, a carefully prepared review of the evils complained of, and the various schemes proposed for the reclamation of the Potomac Flats and the sewerage of the city.

Price, bound in cloth, $4.00. Postage 40 cents.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S.A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst*.

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

THE BELL WATERPHONE COMPANY.

Sole Proprietors of the Invention for the Prevention of the Waste of Water, and the Discovery of Leaks in Water Craft and the Detection of Defects in Mechanical Movements.

It is specially adapted to the use of Plumbers and for Water Works.

Address,
Thos. J. Bell,
Manager,
CINCINNATI, OHIO.

Proposals.

PROPOSALS FOR HOT WATER HEATING APPARATUS AT CHARLESTON, WEST VA.

OFFICE OF SUPERVISING ARCHITECT, TREASURY DEP'T., WASHINGTON, D.C., *Dec.*, 30, 1882.

Sealed proposals will be received at this office until 12 M., on the 23d day of January 1883, for furnishing and fixing in place complete, in the Court House and Post Office building at *Charleston, West Va.*, a low temperature hot water heating apparatus in accordance with drawings and specification, copies of which and any additional information may be had on application at this office or the office of the superintendent.

JAS. G. HILL,
Supervising Architect.

Dredging harbor and furnishing pine and hemlock timber for breakwater. Until Jan. 10, 1883. Address, W. H. H. BENYAURD. *Major of Engineers*, U. S. Engineer Office, Chicago, Ill.

Furnishing supplies of cotton rope for tests. Until Jan. 15, 1883. To be delivered in New York Navy Yard. Address, Hon. WILLIAM E. CHANDLER, *Sec'y of the Navy*, Navy Department, Washington, D. C.

Building Lock No. 2, of Great Kanawha River. Until January 31, Address, E. H. RUFFNER, *Capt. of Engrs.*, U. S. Engineer Office. Charleston, W. Va.

Furnishing rope, wire, spikes, round iron, yarn, oakum and nails, Until January 15. Address, O. H. ERNST, *Maj. Engrs.*, U. S. Engineer Office 404 Market st., St. Louis, Mo.

MR. C. N. DOUGLASS'

SCHOOL FOR BOYS.

Thorough preparation for the best Colleges and Scientific Schools and for business. Pupils received at any time. The classes are small, and much of the teaching individual. References furnished on application.

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 *Superior Street*,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL S TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes. Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

Salt-Glazed, Thoroughly Vitrified

Sewer and Drain Pipe,

MANUFACTURED BY

OTIS & GORSLINE,

At ROCHESTER, N. Y.

New York Office and Yard, { EAST 138TH STREET, MOTT HAVEN.

These pipes are made from a combination of superior clays, are thoroughly VITRIFIED, and SALT GLAZED. Indestructible from the action of all the elements, can be laid perfectly tight, and more durable than iron.

THE

RIDER COMPRESSION

PUMPING ENGINE,

(Hot Air),

For city or country residences where it is required to raise a supply of water, is the most *Perfect Pumping Machine* in the market. Its marvellous *Simplicity*, absolute *Safety*, great *Economy* and *Effectiveness*, render it far superior to all others. Can be run by any inexperienced person. Send for catalogue and price list to

CAMMEYER & SAYER,
93 Liberty St., New York,
and 20 W. Lake St., Chicago, Ills.

Please mention this Paper.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet: With gas furnace, $210. With coal furnace, $220
Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet: With gas furnace, $260. With coal furnace, $275
Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet: With coal furnace only.....$375
Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration.

Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

The "EUREKA" Wheel

Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which in other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.
The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.
The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.
Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street
PHILADELPHIA, PA.

Over 100,000 *now in use!*

BUNDY'S RADIATOR

is made for direct and indirect Steam Heating for Public or Private Buildings. Tested and guaranteed to stand a steam pressure of 150 lbs.

JENKINS' PATENT

(BRASS, AND IRON BODY BRASS MOUNTED,)

GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

INSIDE VIEW OF GATE VALVE.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat.) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

Western Branch, 130 Lake Street, Chicago, Ill.
H. A. ALLYN & CO., Managers.

CREQUE'S PATENT

New Circulation

RANGE BOILERS

13 different styles—adapted and warranted for every possible situation.

ESSENTIAL FEATURES.

1st. Cold water is introduced at the bottom of the boiler, while hot water is injected into the top of the boiler.

2d. By this system the chilling of the hot water in its passage to the top of the boiler is avoided.

3d. Hot water being stored at the top of the boiler without chilling, it can be used immediately; thus making the boiler serviceable as soon as the water-back is heated.

4th. The circulation is positive in direction and rapid in action, and heats in very much less time.

5th. Circulation being positive, there is no cracking, snapping or rumbling in the boiler.

6th. There being no reversal of circulation, there is no sudden expansion and contraction of the boiler shell. The boiler will therefore wear longer.

7th. In case of a part of the boiler being filled with steam, a sudden injection of cold water does not condense it, as the injection is at the *bottom* of the boiler, thus forcing the heated water above it to fill the space left by escaping steam, when a hot water cock is opened.

8th. A considerable saving in material and labor in cost of setting up the boiler and connecting pipes.

9th. In consequence of a rapid, invariable and constant circulation, much more hot water can be obtained from a small sized boiler than from a much larger boiler of the old method of circulation. These boilers are arranged to meet every conceivable requirement of location or condition. To both the plumber and architect this is a great advantage, while it also lessens the cost to the builder.

N. B.—Please send for Catalogue fully explaining the various situations for which these boilers are intended.

WORKS AT YONKERS, N. Y.

OFFICE AT 348 BROADWAY, NEW YORK.

Heat Saving AND Ventilating Grate.

EDWIN A. JACKSON & BRO.,

77 Beekman Street, New York.

THE CHEERFUL, COMFORTABLE FIRE OF THE OPEN GRATE. THE HEATING POWER OF THREE ORDINARY GRATES. CAN BE ARRANGED TO HEAT ROOMS ON TWO FLOORS. AN UNLIMITED SUPPLY OF PURE WARMED AIR. MADE OF THE FINEST FINISH IN NICKEL, BRONZE OR BRASS.

☞ Send for descriptive circulars and designs.

MINTON'S TILES,

Glazed and Unglazed.

For VESTIBULES, HALLS, HEARTHS, etc., and for Exterior Decoration. Also, Plain White, and Tinted Tiles, for KITCHENS, BATH ROOMS, WATER CLOSETS, etc.

Also, PLUMBERS' MATERIALS of all kinds.

MILLER & COATES,

279 PEARL STREET, near Fulton St., NEW YORK.

GAS FIXTURES.

NEWEST AND CHOICEST DESIGNS.

Metal and Porcelain Lamps, &c.

Fine Clocks,
Mantel Sets,
Artistic Bronzes,

In addition to those of our own manufacture we offer an unequalled assortment, selected this season with great care in Paris, Vienna, Berlin, London and other European cities.

Also, articles of ORNAMENTAL METAL WORK, both antique and modern, in great variety and elegance of workmanship.

Our rooms have been recently fitted up with special regard to the exhibition of these goods, to an inspection of which a cordial invitation is extended.

MITCHELL, VANCE & CO.,

836 AND 838 BROADWAY AND 13TH ST., N. Y.

SPENCERIAN INK

Extra Black, Blue Black, and Copying, all of superior quality, claiming SPECIAL EXCELLENCE in the essentials of FLUIDITY, COLOR and DURABILITY. Circulars free.

The date when the subscription expires is on the Address-Label of each paper, the change of which to a subsequent date becomes a receipt for remittance. No other receipt is sent unless requested.

British Subscribers who wish to receive this paper without interruption should renew their subscriptions a month before expiration, with Messrs. E. & F. N. Spon, London, in order that they may be able to notify the Publisher, in New York, of the fact.

THE COMMANDMENTS OF "THE SANITARY ENGINEER."

I. Thou shalt not worship any patent fixture, or system, or process.

II. Thou shalt not darken sanitary counsel by words without knowledge.

III. Thou shalt not be dirty—either as to thy person or thy house.

IV. Thou shalt not make false statements, either to get gain or to secure reforms.

V. Thou shalt sustain thy sanitary authorities in their fights against the miserly, the ignorant and the uncleanly.

VI. Thou shalt not eat uncooked meat.

VII. Thou shalt not befoul thy neighbor's drink, or his air, or his food, or anything that is thy neighbor's.

VIII. Thou shalt be vaccinated, thou, and thy wife, and thy children, thy man-servants, and thy maid-servants.

IX. Thou shalt not worry, or fret thy gizzard; either over that which thou canst help, or that which thou canst not.

X. Thou shalt read THE SANITARY ENGINEER, and profit by the same, and cause thy neighbor to do likewise.

MALARIA.

The subject of malaria and its causation is becoming increasingly important from the business point of view as well as from that of the physician and sanitarian.

The question as to the dependence of malarial fevers upon the presence of mill dams may involve large commercial interests, as in the recent trial in Massachusetts, thus bringing it before the courts, and then something more than hypotheses and conjectures are necessary.

The prevailing scientific opinion at present is that malaria is caused by micro-organism, and several observers claim that they have demonstrated the particular germ. Unfortunately each one has found a different form, while a number of competent observers have not as yet found any form which they are willing to accept as the specific germ.

We have thought that our readers would be interested in a statement of what is really known on this matter, and what is as yet mere conjecture, and have, therefore, induced Dr. George M. Sternberg, of the United States Army, who has made a study of this subject for the National Board of Health, to prepare for THE SANITARY ENGINEER a series of papers, the first of which is given in this number.

When the publication of these papers is concluded we may have some comments to make. At present we need hardly assure our readers that Dr. Sternberg is good authority on the subject of which he writes.

THE EMPLOYMENT OF PHYSICIANS AS SANITARY ADVISERS.

Dr. W. F. Phillips, of Andover, England, has, during the last two years, addressed several communications to medical journals on the systematic prevention of disease by medical men, and has now presented his plan to the public in a little pamphlet entitled "A Plea for Medical Providence, and the Prevention of Disease in General Practice." Taking the ground that "at present the interests of the medical profession and of the public are opposed, that is to say, the greater the amount of illness, the better it is for the doctors," he proposes, as the simplest remedy for this state of things, the following:

Let any person, for himself, or herself and family, go to a medical man and ask him to accept a sum of money agreed on for the year, to furnish attendance and advice, it being understood that midwifery, the treatment of fractures and dislocations, and all serious injuries resulting from accident and surgical operations, involving much trouble, shall be considered as extras, to be paid for as at present. The annual payment would vary from $2.50 to $10 or more for each individual, according to circumstances. The advantages of this scheme are very clearly pointed out, and it would seem that Doctor Phillips has made practical trial of it in his own neighborhood.

We should like to see it fairly tested in this country, but we fear that at present there might be some difficulty in finding a large number of physicians who are sufficiently familiar with sanitary matters to make their advice as practically useful as it should be, and we also doubt whether competent physicians of good repute would be willing to make such a contract.

THE MAYOR'S ANNUAL MESSAGE.

The inaugural message of Mayor Edson, of this city, shows that in the interval between his election and the assumption of his duties, the late President of the Produce Exchange has been pretty thoroughly occupied in the investigation of the complex affairs of the new and evidently unfamiliar business upon which he has entered. His statistics, gathered from the various departments are undoubtedly correct, and are not particularly interesting. His recommendations, where they have evidently emanated from the experienced officers of departments, are not injudicious. But when he enters upon the consideration of subjects with which his previous training and duties have not made him familiar and ventures to make suggestions "out of his own head," he displays a want of knowledge that is, to say the least, unfortunate in a prominent public officer, at the outset of his career.

In alluding to the construction of a new aqueduct, he says, "It would, in my opinion, be wise, before finally adopting any plan, to have the opinion of *business men*" (the italics are our own) "as well as engineers, concerning its practicability, the probable cost, and the time required for construction. The execution of whatever

Digitized by Google

plan may be adopted should be surrounded with safeguards against extravagance or unnecessary expenditure; to this end I believe you will join me in the recommendation that to a controlling extent the work be supervised by men of known integrity, who possess some practical knowledge of such matters."

In the first place, the making of a distinction between business men and engineers is needless. If there is any class of men who are pre-eminently *business* men, and who are accustomed by their daily training and their daily work, to the management of large affairs, it is civil engineers. The skill, the promptitude, the breadth of view, the mental grasp demanded in the prosecution of the great works which come under the control of the engineer, and the multifarious questions which daily and hourly arise in his practice, are far more than are required for successful speculation in the street or the exchange. There are, of course, all grades of engineers as there are all grades of merchants, lawyers and physicians, and an able man in any one of these professions may be a better judge of the proper course to pursue in a certain case than a man of low attainments or skill in the profession, particularly relating to that case. But that is no reason why in a case involving great questions of constitutional law, of surgical practice, or of hydraulic engineering design and construction, the opinion and advice of so-called business men should be called for as to the practicability and advisability of what a Storey, a Wood or a Stephenson recommended. If there were more attention paid to professional advice and less to the crude opinions of the men of miscellaneous avocations who happen to get into office, our public works would cost less and be better managed.

As regards the supervision of construction, the selection of men of "known integrity" is certainly desirable, but when his Honor talks of their possessing "some practical knowledge of such matters," he betrays his want of knowledge of his subject and his lack of appreciation of the difficulties of getting good work done. It is the men with "some practical knowledge" that are the curse of engineering work. Their presence on a managing board involves invariably a weakening of the engineer's authority and a strengthening of the contractor's hands in slighting his work. There must be no divided authority.

In mentioning the tearing up of the streets by the steam heating companies, the commercial element is brought into prominence again by the mayor, in his remark that "here would seem to be an opportunity for some person of enterprise, or for some private corporation to mature a plan for underlaying the streets with a single excavation, which shall provide not only for the water, gas and steam pipes, but also for telegraph and telephone wires and other appliances which the public convenience may hereafter require. The space under the streets would thus become as susceptible of benefit to the citizens as rapid transit has made the space above the streets." This is a remarkable suggestion for the chief officer of the city to make. If the "self-government" that he so pathetically calls for in another part of his address, is to consist in handing over all the rights of the public in the thoroughfares to enterprising individuals and private corporations who do as they please, the less "self-governed" New York is, the better will we be off. A subway for all pipes and wires is unquestionably desirable, but it ought never to be given over to private control. From house line to house line, and from the centre of the earth to the clouds, the public streets should be controlled by the public.

QUARANTINE FEES.

The New York *Times* of Jan. 3d contains the following:

NEW ORLEANS, Jan. 2.—Some time ago Morgan's Louisiana and Texas Railroad and Steamship Company applied for an injunction restraining the State Board of Health from collecting charges imposed by the Quarantine laws upon vessels entering the port of New Orleans, and from detaining their vessels on account of the non-payment of these quarantine fees. The company claimed that the laws under which the fees are demanded were in conflict with the Constitution of the United States in their several respects. In the Civil District Court to-day Judge Monroe delivered a long decision in the case. In concluding his opinion he said: "It is remarkable, in view of the fact that the convention which adopted the Constitution of the United States distinctly determined, after the most elaborate and earnest discussion, that the States should not be allowed without the consent of Congress to levy duties on tonnage for any purposes whatever, that it should still be considered a matter of discussion as to whether such duties may not be imposed for the support of a police or quarantine regulation established by a State for the protection of the health of its citizens. There is no reason for requiring that the quarantine service should be supported by those who are under no legal obligation so to do." The injunction was made perpetual restraining the Board of Health from the collection of quarantine fees. This will be a fatal blow to the local health board, as a pay-roll of some 20 employés has been maintained on these collections, and the State and city have made no provisions for the maintenance of the board.

This is a matter of much importance and the decision, if sustained by the Superior Courts to which it will probably be appealed, will affect many other ports besides New Orleans, and may require a change in the system of the Port of New York.

New Orleans has used her quarantine to make money to pay expenses which the city should itself meet, and the Board is not likely to meet with much sympathy. When we get the text of the decision we will return to this subject. Meantime we will only say that we think all quarantine inspections should be free of cost to the vessel.

We are now able to congratulate Boston plumbers and citizens on the final passage of the ordinance regulating plumbing in that city. By an oversight, which we mentioned last week, this ordinance having been once before passed by the City Council, was omitted from the Revised Ordinances. It was taken up and passed again by the Council at their session of the fourth inst.

Montreal, Canada, also seems to be on the point of adopting a system of official regulation of plumbing and drainage. For several years a city by-law for the regulation of the public health has been under discussion. It has been finally completed and submitted to the Board of Health. Chapter II, which is chiefly devoted to the proper construction and management of buildings, contains two sections on plumbing and drainage which allow plumbing to be done only by licensed plumbers, and define in detail what may and what may not be done in constructing plumbing and drainage work. So far as we can judge from the Montreal press, the by-law receives general support and is likely to be adopted.

PLUMBING OF THE BROOKLYN PRIVATE SCHOOLS.

The special examination by the Brooklyn Health Department of the plumbing in the private schools of that city is nearly complete. Up to the close of last week Commissioner Raymond had received reports of 109 examinations. Of this number 41 show defective work. The nature of the defects in each case we hope to present in detail hereafter. The number of pupils in attendance at each school and the number absent from sickness at the time of the inspection was also ascertained. In the 109 schools reported on there were 4,107 pupils in regular attendance, of which number 77 were absent from sickness of all kinds, one-seventh being from contagious diseases, as follows: whooping-cough seven, chicken-pox two, and scarlet fever two. The above number of schools examined does not include the parochial schools nor the large Packer Institute, the plumbing of which was reconstructed during the past summer in accordance with the law.

LETTERS TO A YOUNG ARCHITECT ON VENTILATION AND HEATING.

BY JOHN S. BILLINGS, SURGEON, U.S.A.

No. XLII.

I come now to speak of a class of buildings in which the subject of ventilation has received more than the average amount of attention on the part of architects—namely, hospitals.

The necessity of providing these buildings with more than the usual means of ventilation has been recognized for a hundred years or more, and in almost every large hospital which has been planned or built during the present century some attempt has been made to provide it. Yet in spite of the experience thus gained, and of some careful studies by physicians, engineers and architects, as to the relative merits of various systems it must be confessed that the results obtained have too often been unsatisfactory.

The bad results of imperfect ventilation or of an impure air supply are more strikingly evident in hospitals than other buildings, owing, in part, to their continuous occupation, in part to the lowered vitality of their inmates, which makes them specially susceptible to unsanitary influences, and in part to the presence of special causes of disease in the form of germs or miasms. The great difficulty in providing a constant and

FIG. 3.—CROSS-SECTION.

sufficient supply of pure air to hospital wards, in such a way that at all hours of the day or night, at all seasons or in all conditions of wind, they shall be free from all odor, and comfortable for the patients, is not so much a want of knowledge of the means by which this may be effected as it is the expense which must be incurred, not only in providing the necessary construction and apparatus for heating and ventilation, but also to keep the system in operation after it has been provided. This expense is almost invariably underestimated, and those who have to furnish the funds for the support of the institution are disappointed accordingly, and in attempting to reduce the cost are too apt to reduce the ventilation also.

The hospitals for which an architect is liable to be called on to prepare plans may be roughly divided into four classes. The first are those intended for the reception of contagious diseases, the so-called pest houses. These are usually

Digitized by Google

cheap temporary structures, hastily erected to meet an emergency, and the architect is rarely consulted with regard to them. It would be much better if he were, for such hospitals should be considered as an indispensable part of the municipal mac: inery of every city of 10,000 inhabitants and upwards; they should be carefully constructed while the emergency is yet afar off, and while they should be simple and cheap, they should have a neat and attractive appearance instead of looking, as they usually do, like an enlarged dog kennel. Their ugly, box-like appearance can be substituted by a simple, broken, cottage-like outline without much additional expense, and they will then be considered as worth taking care of. They will be one story wooden buildings, with wards containing about six beds, heated by a stove in the centre. Through or around this stove the greater part of the fresh air should be introduced in cold weather, while the foul air should be removed by a shaft reaching nearly to the floor near the stove, and containing the stove pipe in its upper part. The amount of air supply should not be less than one cubic foot per head per second. Upon a larger scale this kind of building is known as a barrack hospital, and excellent results have been obtained from it. To illustrate its possibilities I give figures showing plan and cross section of one of the barracks of the Roschdestwensky City Hospital in St. Petersburgh.

This hospital has three of these barracks, constructed in 1871–72, and they have proved to be a great success, being comfortably warm in the extreme cold of the Russian winter, and giving excellent results in cases of typhus and also in surgical cases.

FIG. 1.—FLOOR PLAN.—1, Porch. 2, Hall. 3, Nurses' Room. 4, Ward Kitchen. 5, Room for two patients. 6, Bath. 7, Ward. 8, Room for two patients. 9, Hall. 10, Wash-room. 11, Water Closet.

FIG. 2.—CELLAR PLAN.—1, Cellar. 2, Soil Pipes. 3, Foundation of Stone. 5, Foul Air Tubes Beneath the Floor. 6, 7, Vessels for Excreta.

The walls of this barrack are triple, enclosing two air spaces. The arrangement of the ward heating and ventilation is sufficiently shown in the figures. The great central German porcelain stove is 14 feet long, four feet eight inches wide and six feet high. This so-called stove is rather a furnace, fired from below, and has through it eight openings for the admission of fresh, warm air into the ward. The foul air flues open into the central smoke flue as shown in the cross-section. Besides this central stove there are three others, and the whole furnish about 103,000 cubic feet of fresh air per hour. When the external temperature is not below the freezing point these stoves are fired but once a day. When between zero and 32° F., they are fired twice a day, and when below zero three, and in extreme cold four times a day. When I was in this ward in August, 1881, it was quite free from unpleasant odor, although it was filled with fever cases—the day was cold and raw, but the temperature of the ward was all that could be desired. It is an interesting hospital, as proving that even in the coldest climates such wards can be made perfectly comfortable and be at the same time kept well ventilated.

(TO BE CONTINUED.)

TENEMENT HOUSES IN AMERICA.

BY A CONTRIBUTOR OF THE LONDON LANCET.

It is popularly supposed that in the large towns of America there are no poor, in the English meaning of that term. This is, however, a great mistake, and as a matter of fact some American cities contain as degraded specimens of the class of people to be found in tenement houses in Great Britain as will be met with anywhere in the world. It may be interesting to inquire how it is that in the New World, where labor is at a premium, and where there is more work to be done than hands to do it, no improvement has taken place in that class of persons who inhabit tenement houses. In a town like Chicago, which has been nearly rebuilt during the last ten years, the cause of the existence of the worst class of tenement house is due to the fact that the enormous number of emigrants who annually enter the capital of the West far exceeds the capacity of builders and capitalists. Hundreds of new houses are erected annually, but an influx of 60,000 or 80,000 emigrants renders it impossible to provide suitable house room for all. In spite of many difficulties, however, it must be confessed that the health authorities, under the energetic superintendence of Dr. De Woolf, the able Commissioner of Health, have done great public service. Mainly at their instigation, and in spite of considerable opposition from various quarters, powers have been conferred upon the health authorities which, as they are vigorously exercised, have proved the greatest boon to the inhabitants of Chicago. The following are the chief sections of an Act for the regulation and inspection of tenements and lodging houses and other places of habitation, which was approved and put in force on and from May 30, 1881. The Act applies to all incorporated cities of 50,000 inhabitants within the State of Illinois:

1. Architects, builders, or other persons interested in any projected tenement, lodging house, or other place of habitation, must submit plans and specifications of any such building to the Health Commissioners, to enable them to examine, approve, or reject the same, unless or until adequate provision is made for the ventilation of rooms, light, and air shafts, windows, ventilation of water closets, drainage, and plumbing.

2. Every plumber interested in the plumbing work of such buildings must receive from, and proceed according to the specifications and written instructions of, the Health Commissioners before commencing work.

3. The plumber is compelled, after the completion of his work, and before any portion of it is covered up, to notify the commissioners in writing that the buildings are ready for inspection, and it is unlawful for any person interested to cover up or in any way conceal such plumbing work in or about any such buildings until the Health Commissioners have approved it.

4. Provision is made to impose a penalty for every such offence of from £20 to £40 upon any architect or builder who fails to comply with the foregoing regulations.

5. A similar penalty is imposed upon plumbers in case they fail to comply with the law, together with a further penalty of "£2 for each and every day such plumbers shall, after first conviction, neglect or refuse to obey the Act or the written instructions of the Health Commissioners," with a forfeiture of his license to do business in the said city for one year after conviction for a second offence.

With the view of facilitating the application of the above Act various printed forms have been prepared by the Health Department, which provide (*a*) plans for ventilation, light, plumbing, and drainage; (*b*) permit signed by Health Commissioner, sanctioning the erection of buildings on the following or some special conditions in certain cases: (1) Every habitable room must have at least one window opening directly upon the street or yard, or upon a court or light shaft. (2) Every light and air shaft for habitable rooms must be at least 12 square feet in area for a three story house, 16 square feet for a four story house, and 20 square feet in area for a five story house; and in every case not less than two feet wide in the clear. Shafts between two houses and common to both must be double this area. (3) All windows which open on shafts shall be hung with weights, so as to slide vertically, each window being not less than 12 square feet in area. (4) Water closets shall not be ventilated by a shaft which ventilates habitable rooms where they do not open otherwise to the external air. Water closets must be ventilated by means of a separate shaft, not less than three square feet in area, to extend above the roof, and to be arranged for the admission of light and air at the top. (5) No alteration in the light and ventilation of the premises (for which a permit is granted) shall be made, except upon the express written approval of the Commissioner of Health; nor shall any additional structure be erected upon the lot without such approval, and a special permit. Printed upon the face of the permit are details of the plan of plumbing, which will be insisted upon by the Commissioner of Health. This plan provides that all materials used must be of good quality and free from defects, and all work must be executed in a thorough and proper manner. All plumbing must be so placed as to be readily inspected. Every soil and waste pipe, iron or lead, must extend through and at least four feet above the roof, be of undiminished size, and provided with suitable top or cap. The house drain, if of iron—a material much used for these pipes in America—shall have a fall of at least half an inch to the foot, and be provided with a proper trap near the street, and with an inlet for fresh air inside the trap. It should run along the cellar walls—a favorite plan in America—and never be hidden underground. All iron soil pipes must be sound, free from holes, of a uniform thickness, of not less than ⅛ inch for a diameter of two, three, of four inches, or $\frac{5}{32}$ inch for a diameter of five or six inches. Before connection they must be thoroughly coated with coal-tar pitch, inside and outside, which must be applied hot. All joints in the soil and waste pipes must be so caulked with lead, or cement made of iron filings and sal ammoniac, as to make them impermeable to gases. When the house drains are not of iron they must have twice the above given internal diameter and half the grade, unless in special cases specially sanctioned. Every sink, drain, water closet, and tub, or set of tubs, must be separately and properly trapped. When a lead pipe or trap is connected with an iron pipe the joint must be made through a metallic sleeve or ferrule, and be caulked with lead. All traps must be ventilated by a special pipe entering above the roof.

Every "safe" under a basin, bath, or other fixture, must be drained by a special pipe, not directly connected with any waste pipe, drain or sewer. Every water closet must be supplied with water from a special cistern, and not direct from the main. No overflow pipe from the cistern to be directly communicated with any soil or waste pipe or drain. No cistern for drinking water to be lined with lead.

It is stated that wrought iron, steam fitted, glazed pipes are the best for house drains, and their use is recommended. When the work is completed, and before it is covered up and the house occupied, the Health Department must be notified, to enable the authorities to send an inspector, upon whose report the Commissioner will act before its final approval. Equally stringent regulations are enforced in respect to the existing or old tenement houses, which are regularly inspected by a staff of trained officials, and it may be said with truth of Chicago that there, if anywhere in the world, the life of a jerry builder, or plumber, or owner is not a happy one.

For this reason, and as a guide to those who are striving for improvement in these matters in England, the above regulations and information cannot fail to be of interest. The whole plan of administering the Health Department of Chicago has been admirably conceived, and is being ably administered by Dr. De Woolf, the present Commissioner of Health. I would advise anyone who desires to have a model set of forms and regulations for controlling the health arrangements of a large town, to write to Dr. De Woolf for those in use at Chicago. It is not a little surprising to find that whereas wages are exceedingly high throughout America, salaries, and especially the remuneration of the health officers, are unusually small and inadequate.

At Boston, Mass., during the last ten years much has been done to secure the health of the inhabitants. It is to be regretted, however, that up to the present time the Health Commissioners have had no control over the sanitary arrangements and construction of habitable houses within that city. In consequence, although the Corporation have established a separate building authority to which all plans are referred, the sanitary arrangements of many Boston houses leave much to be desired in the interests of the health of the townspeople. It is always unwise to have a divided responsibility, and in any case where matters of health are concerned, to separate the supervision and control of the sanitary condition of habitable houses from the Health Department, is almost, if not quite, as foolish as to attempt to separate the dieting of a patient from the control of the physician who has charge of the treatment of the disease from which he is suffering. It is surprising to find this fatal administrative mistake in a city like Boston, which is certainly entitled to rank high amongst American towns for its culture and sound public life. Doubtless attention has only to be called to the subject to ensure its immediate rectification. Nothing could be more detrimental to the best interests of the citizens than this divided responsibility, and the sooner it is altered the better it will be for the health of the city. Great praise is due to the Board of Health for the good sanitary work they have done in Boston during the past ten years. Few, if any, cities have better quarantine arrangements, few have officers more imbued with a genuine enthusiasm for their work, few take greater

Digitized by Google

precautions to ensure the health of all classes, and no American city keeps its streets and thoroughfares cleaner or in better order. Still, when all this is said, something remains to be done, and it is not a little remarkable to find that in its regulations for the construction and maintenance of tenement houses Boston is much behind Chicago. Indeed, the whole of the statutes and ordinances relating to the public health of Boston might be overhauled and supplemented with advantage. In some cases they are contradictory. Thus, it is provided by article 106 that no cellar dwelling shall be occupied which has more than half its entire height below the level of the street, whereas section 113 enacts that a cellar may be occupied providing at least one foot shall be above the same level. Again, the conditions upon which tenement and other houses are allowed to be built require amplification and revision, as at present they leave much to be desired. The existing tenement houses in Boston may be divided into three classes—(*a*) undesirable, (*b*) fair, (*c*) good. With a population of nearly 400,000, Boston has some 20,000 or 25,000 people who occupy tenement houses, and of these some 10,000 inhabit the grade of house here classed as undesirable. A building known as the Crystal Palace may be taken as a fair specimen of the first type. It has accommodation for thirty-eight families, and is occupied on an average by some twenty-five only. The tenants pay for one fair-sized room and an annex or large cupboard with an opening into the air shaft, from 5*s*. to 6*s*. per week. On every landing there is a sink common to all on that floor, and a supply of cold water. There are no water closets, but three very dirty and badly-kept privies, unlocked, and open *tout le monde*, are situated outside and behind the house. The house itself is not clean, and is old and in bad repair. Still it is fair to say that the present condition is not nearly so bad as formerly, it having been occupied by no less than 100 families some years ago.

At present there is no overcrowding, although the state of affairs when 100 families existed here must have been horrible indeed. The present occupants are nearly all Irish, for the most part rag-pickers by trade, who are certainly, notwithstanding their dirty condition, far cleaner here than I have found them at home—in Dublin, for instance. This house is owned by a respectable man, who rarely, if ever, visits it, for the reason that he has sublet it for $1,376 per annum, say £275. If he came there once a week, probably he would pull down the house, or at any rate keep it in better repair. No. 190 Kneeland street may be taken as a good example of the second class of house. It is owned by a publican of good standing and respectability, who takes some interest in his property, refuses to sublet, and manages it himself, through a janitor, who collects the rents, and resides on the premises. It contains twenty-five families when full, and is in many respects far cleaner and better kept than the Crystal Palace. The occupants, too, are more respectable and cleanly, but the rents are very little, if any, higher than those already given. Indeed, there are vacant rooms of a superior kind to let here for which the same rent is asked at the Crystal Palace, although the accommodation at the latter, to say nothing of the unpleasant neighbors, is far inferior to that here offered. This proves that high rents do not keep people in the undesirable class of tenement house, of which the Crystal Palace is a type, but, on the contrary, the people who there crowd together do so from choice, and not from necessity. Further it may be noticed that everywhere the children looked healthy, a fact accounted for by the medical officer's statement that amongst the children it was a case of the survival of the fittest. At 190 Kneeland street the privies are outside the house, the doors are all locked and the whole of them are fairly clean. This was another proof of the admitted fact that to secure cleanliness in these places they must be kept locked, be allotted to certain families only, and so the individual responsibility is easily brought home. This plan works well even in Ireland, and its adoption throughout Boston would be desirable. Columbia Building, Elliot street, was shown as a fair specimen of the best class of tenement house. Its situation is, however, not calculated to promote the health of the inmates, as it is much shut in, and proper ventilation is not therefore possible. In the entrance-hall is a board, called a "directory," upon which are given the names and addresses of the owners and janitor, and the names of the occupants of all the rooms. In the basement are situated a number of cellars; and each set of rooms has a separate cellar allotted to it. The rooms are well-proportioned and comfortable, but the plumbing and drainage arrangements leave much to be desired. The water closets are situated in the centre of the building; they have no communication with the outside air, and the effluvium and sewer gas are preceptible in the living-rooms and entrance-halls, and on the staircase. The rents here are much higher than at the Crystal Palace and Kneeland street. They average from 12*s*. to 32*s*. per week. The occupants consists of Scotch, German and a few Irish mechanics, all superior people earning good wages, and some, at any rate, conscious of the insanitary condition of this house, and the need which exists for structural alterations.

Now, taking these three types of tenement houses and their present condition, it may not be unprofitable to point out where in each case the health authorities might exercise the powers they possess with advantage. At the Crystal Palace no whitewashing has been done for quite twelve months, and Section 116 of the Statutes might be enforced with advantage, as it provides that all tenement house owners shall "whitewash the walls and ceilings thereof twice, at least, every year, in the months of April and October." Both at the Crystal Palace and at 190 Kneeland street. Section 112, regulating the condition of privies and privy vaults, ought to be strictly enforced. It is a little surprising why this has not been done before, especially as the buildings bear evidence of constant inspection in other respects. At Columbia Building, a class of tenement house which appears to be rarely inspected in Boston, the state of affairs is certainly not creditable, and ought to be remedied at once. The building is comparatively of recent construction, and its bad and unhealthy sanitary condition is no doubt due to the fact that the Health Department has no control over the erection of dwelling houses in Boston. This is a state of affairs which calls for alteration, and the sooner the change is made the better. It is true that when a building is occupied it comes under the control of the health authorities, but Columbia Building shows how imperfectly and at what increased expense proper ventilation and plumbing can be introduced *after* completion. If the plans of this tenement house had been submitted to the Health Department before its erection no such evils could have existed. Here is something for Boston people to put right, and the sooner they see to it the better for all concerned.

In New York, up to the year 1878, the tenement house was not only a scandal but a danger to the public health. Even to-day the condition of affairs is not satisfactory, and in spite of the energetic action of one of the most capable of Boards of Health to be found in the United States, much remains to be done. Here, as in Liverpool, the difficulty is to provide suitable accommodation for and to restrain the large floating population which constitute the dregs of the emigrant class. In a tenement house in Mott street, situated almost exactly opposite the offices of the Board of Health, and plainly visible therefrom, is situated a tenement house, or rather houses, which are as bad as anything to be seen anywhere to-day. They are occupied by Italians, but though poor the people themselves are fairly cleanly, and their rooms are at times, considering their surroundings, wonderfully clean. The closets, however, are in a disgraceful condition, and present a spectacle as filthy as the slough of despond itself. This state of affairs could be remedied; it has been vastly improved at Boston, and it is not creditable that New York should long lag behind. Unfortunately there are many of these tenement houses in New York, and little hope is held out of their extinction or removal. Much good has, however, been done since 1878, when the SANITARY ENGINEER drew public attention to the condition of the New York tenement houses, and offered a prize of $500 for the best design for such a building. This competition excited keen interest, and resulted in much improvement. Public attention was aroused, clergy and laity combined to urge reform. A joint committee, consisting of the judges and a committee of the State Charities' Aid Association, was formed, and in the result an amendment to the Tenement House Act was passed by the State Legislature in May, 1879. This Act limited the space to be occupied by any tenement house to sixty-five per cent. of the lot it occupies, required all bedrooms to have windows, with direct light and air, and greatly increased the powers of the Board of Health to remedy the abuses in such buildings. Two associations were formed to erect model dwellings for working men, and several improved tenement houses have been and are being erected by private individuals. No plan can be settled now without the approval of the Health Department, and all plans which fail to meet the requirements of the law are invariably rejected. A visit paid to one of the blocks recently erected by the Improved Dwellings' Association, afforded many satisfactory proofs of the way in which these buildings are appreciated by the class for whom they have been erected. The dwellings of this company are situated on First Avenue, and consist of thirteen houses of six stories each, with basements used as cellars and laundry. There is here accommodation for 218 families in suites of two, three, and four rooms, which are rented at from 8*s*. to 16*s*. per week. There are a laundry, reading-room and bath-house connected with these buildings, and there is ample playground for the children. Care has been taken to make the sanitary arrangements perfect; but a casual visit leads to the conclusion that at present the soil-pipes have to be better ventilated and the drains to be properly disconnected from the main sewer before the health of the inmates is likely to continue good. These buildings were opened in May, 1882, so the managers have had but a short experience of the working. The mortality among the children, of whom 400 have been residents, has been a total of three deaths, and out of 218 sections no less than 157 have been occupied. There is a slight discipline enforced. Irish people, who are unable to give a clean bill of health as to drink, all scolds, and mothers who cannot control their children, are not admitted. The refusals are in practice very few, the night janitor reports all cases of drunkenness, and after two cautions a third offence is visited by a notice to quit. Credit is not given except in case of death or sickness. There are resident at the present time within the buildings twenty-one French Canadian families, who are reported to make excellent tenants and to be very respectable. I wish the project every success, and, judging from what I saw, this association deserves and will obtain it. The great difficulty in New York is the expense of sites, land being so valuable, and this circumstance is likely to delay the erection of an ample quantity of suitable tenement houses.

In Philadelphia there are practically no tenement houses, as here land is plentiful, and it is the fashion for every man to own the house in which he lives. Hence, poverty is rare, thrift is everywhere apparent, and the large number of small houses or pretty cottages fills the visitor with astonishment. It would be a grand thing if every father of a family could own his own house as he does in Philadelphia. This is something for us to aim at accomplishing where possible, and its general adoption would be indeed an approach to the millennium. It is not possible to obtain this in England, but in Ireland and America the general adoption of this Philadelphian system is greatly to be desired.

THE MAN-HOLE SCARE.

The outcry against the system of open ventilation of the public sewers into the centre of the streets, says the *Builder*, lately raised, has had a powerful effect in alarming the minds of the general public, whose confidence in such matters is based on the opinions of experts. Its example has caused medical officers of health to be so bold in their statements concerning the evils arising from the gases escaping from the man-holes, that the average member of the community half believes that the sewerage system of our best towns, instead of being the means of carrying disease away from our homes, are actually the carriers of it to our very doors.

The Medical Officer of Health for the parish of Chiswick startled his Board a few weeks ago by stating that he knew of no other cause for a case of enteric fever in the parish than the exhalations from the man-hole-ventilator in the street where it occurred. The Board promptly ordered an inquiry into the case, with a view to knowing whether their sewerage system, just completed, at a cost of nearly 80,000*l*., was really a means of distributing disease and perhaps death. Dr. Corfield, Professor of Hygiene in University College, was called in, and has presented his report on the case. The man-hole-ventilator alleged to be the cause was about 40 ft. from the house in which the case occurred. Inside the house he found that the scullery sink-stone was connected directly to the sewer, and that the only protection from the in-rush of gas into the house from it, was a small bell-trap with a water-seal of at most ¼ in. When he removed the top of the trap, and held a lighted wax match over the mouth, the indraught was sufficiently powerful to cause the flame to flicker violently. He further found that the water service was intermittent, and that one cistern alone supplied the water-closet and the taps inside the house. He stated that, in his opinion, the disease was more probably caused by the sanitary defects inside the house than by the exhalations from the man-hole.

CORROSION OF UNVENTILATED PIPES AND TRAPS.

The accompanying sketch from the *Sanitary Record* shows the corrosive action of the pent up gases in unventilated plumbing. This lead (D) trap, still much used in England, though condemned by the best plumbers and sanitary engineers, was fixed below a water closet, without ventilation of trap or soil-pipe. It will be seen that it is much eaten away.

OFFICE WATER CLOSETS.

During the past summer the water closets and urinal in the building in which the offices of THE SANITARY ENGINEER are located were in an offensive condition. The attention of the owner having been called to this fact, he very readily gave orders for the reconstruction of the entire work. A brief account of what was found by the plumbers Messrs. Morton & Bathe, and a description of their reconstruction may be of interest.

Valve pan closets flushed from a tank on the top floor were formerly used. The branch from the soil pipe to the closets had a "dead end" at the last fixture and none of the traps were ventilated. The ends of the lead traps entered iron ferrules in the Y-branches without solder, and several of the hubs were split. There was no means of flushing the urinal and the floor of the urinal-stall was of

Digitized by Google

wood. There were no ventilating flues, and the atmosphere about these fixtures was sickening.

The new arrangement is shown in the accompanying sketch. The closets are hoppers with automatic flushing arrangement from separate cisterns. The branch from the soil pipe is extended up through the roof full size and from it a two inch iron branch runs back behind the closets and takes two inch vents from each trap. The urinal stall has marble back, sides and floor. The urinal is flushed through a self-closing cock, between which and the urinal is a branch to supply the trap of the foot waste. The vents from this trap and that on the urinal waste are

larger than shown, being one inch. A tin pipe of about 25 inches in cross-sectional area starts from a hood over the urinal-stall and runs to a heated chimney flue, having two inch by three inch openings over each closet with small hoods attached to each. The sketch is incorrect in not representing openings at the bottoms of the doors about five inches high. The windows over the doors are pivoted at the top and bottom and are generally kept open.

A YEAR OF SANITARY WORK IN BROOKLYN.

The public are aware that much work of sanitary importance has been done by the Brooklyn health authorities the past year. The enforcement of the plumbing law, owing to lack of means, was delayed until last May, at which time it was vigorously entered upon; the question of the pollution of well water in cities has also been investigated; an effort, as we are informed, with considerable success, has been made to prevent the sale of unwholesome meats, and at present the plumbing of the public schools is under consideration and will be made the subject of an early report.

A digest of this year's work is now presented in Health Commissioner Raymond's report to Mayor Low, for the year ending Nov. 4, 1882. The mortality indicates a death rate of 24.97 per 1,000 against 24.83 for the preceding year. A steady increase is observed during the last few years; in 1878 the death rate was 20.85; in 1879, 21.08; in 1880, 23.33; in 1881, 24.83, and in 1882, 24.97. The increase of the death rate over the preceding year is attributed to the great mortality among infants, due to the intense heat the past summer; among persons over five years of age the health has been rather better than last year. On the general sanitary outlook of the city, Dr. Raymond remarks, that "we are favored with a pure and ample water supply and by a situation forming a pure atmosphere—two conditions that are vital to healthful living. These factors, together with the proper development and employment of the sewer system of the city, cannot fail, I think, to eventually reduce the unfavorable mortality roll and place us in the list of the most wholesome of the centres of population."

With reference to the contamination of the wells, Dr. Raymond says that about four years ago the attention of the Department of Health was called to the subject by an examination of thirteen cases of typhoid fever, eight of which were attributed to pump water. While the connection between the disease and the pump water was not absolutely demonstrated, yet in those cases the conclusion seemed irresistible that some such relation existed, and at the request of this Department the Common Council caused the suspected well to be closed. About the same time attention was called to another pump, the water of which was largely used by the children attending one of the public schools. This pump was within ten feet of a cow stable, and the drainage from it flowed toward the well. Chemical analysis revealed the fact that the water was contaminated, and being pronounced unfit for human consumption, the Common Council ordered this well closed. In July the water from five wells was submitted to the chemist for analysis, and his report was such as to condemn them all. Testimony before the Committee on Public Health of the Common Council showed that many of the wells of the city were constructed as long ago as 1850, some even in 1845, and that, situated as they are, alongside the street gutters, it was impossible that they could have escaped contamination. Since that time the water from other wells has been examined, so that we have now the analysis of 43, and of the number 39 or 90 per cent. have been found unfit for human consumption. Since January, 1881, 21 have been closed and the others that have been condemned are now awaiting the action of the Common Council. Since public attention has been directed to the matter, requests have been made by citizens and physicians for chemical analyses of water suspected to have been the cause of severe and, in one case, fatal sickness. The analysis demonstrated that the water was contaminated, probably with sewage, and could well have been a factor in the production of the illness.

The enforcement of the plumbing law has already, in the Commissioner's opinion, produced the most beneficial results. Up to that time there was no restriction as to the manner in which plumbing should be done, and the builder and the plumber had no difficulty in palming off upon the public work which was constructed without the least regard to anything except a quick job and a speedy return of the money invested. Some of the most recently constructed houses were found without traps and with open joint pipes, a constant invitation to disease to do its decimating work. Happily, all this is changed, and we now find a class of plumbing which is equal to the best that modern science and art can suggest. Under the provisions of this act all the plumbing and drainage of new buildings must be done according to plans previously approved by this department, and the work must be left uncovered until approved by our inspector. So perfect is the system that no water can be obtained in the house until this department has notified the Board of City Works that the necessary permit can be given. There have been thus far 500 plans submitted, representing 600 houses. If we calculate nine persons to each house we represent a population of 5,400 who may rely upon having secured homes which have been watched as they were being built to see that no one through neglect or a desire for gain has jeopardized their lives or the lives of their children.

Dr. Raymond recommends the continuation of the Knickerbocker avenue and Third avenue sewers to tide water, and the acquirement of a hospital for the treatment of such cases as require isolation, which have now to be sent to Flatbush.

It is a good augury for the future that in an experience of ten years in public work there never has been a period when the relations of the various departments have been so harmonious, all working together for the public good, and without any jar or clashing. The Board of Estimate has raised money adequate to the needs of the Health Service, and a definite plan of work can be laid out for the coming year with the assurance that it can be carried into execution.

WHERE THE SEWER GAS CAME FROM.

The dread of sewer gas is one of Boston's monomanias. Of course too great care to exclude it cannot be taken. Mrs. Jones lives in mortal horror of even the slightest unpleasant odor. Having cultivated her sense of smell to the highest possible point, she can detect an odor reduced to a thousandth potency. When she alighted from her carriage and entered her palatial residence a few days since she exclaimed: "Sewer gas!" The household was in a state of turbulency at once. The plumber was sent for. He detected something—but he did not think it was sewer gas. "Don't tell me," said Mrs. Jones, and sent for the family physician. He thought that it possibly might be sewer gas. Mr. Jones pooh-poohed the whole thing, for hadn't he paid $200 to have his plumbing overhauled? It was not a merry Christmas in that house. One of the girls was taken ill—and this was a clincher. The family physician pronounced it indigestion, but Mrs. Jones knew better. In another week the family would have moved into the nearest hotel had it not been that Mr. Jones, while inspecting the back yard, discovered that the man who put manure around the grape vines, instead of carrying off the surplus, had banked up the inlet of the cold air box to the furnace.—*Boston Journal.*

Four children recently died within three days of scarlet fever in a Brooklyn residence which is said to have been supplied with all the latest improvements in sanitary plumbing. The Health Commissioner will cause an examination to be made, but does not anticipate finding any defects.

After one teacher has died, another gone into consumption and a third on the way thither, it has been decided that the dampness of the Elm street school building basement is too great to warrant the continuance of a school therein.—*Waterbury American.*

FATAL RANGE EXPLOSION.

A fatal explosion took place yesterday at the residence of Mr. H. S. G. Archer, No. 146 Mansfield street, by which a young girl, 19 years of age, named Louise Hamlin, was instantly killed. The accident occurred about eight A. M., and is thus explained. The stove had been cold since early the day before, and during the night the water had frozen in the pipes, and the sudden heat, on the fire being lighted, caused the explosion. The kitchen stove was completely overturned, and the unfortunate girl, who was employed as a servant, was struck by two large pieces of iron, one on the side and the other on the forehead, the latter badly fracturing the skull.—*Montreal Star, Jan. 2.*

This is the second fatal accident from exploding ranges which has come to our notice within a week. If people will take the simple precautions we have time and again called attention to such casualties will not be reported.

MALARIA.

BY GEORGE M. STERNBERG, M.D., SURGEON U. S. A.,
Late Member of the Havana "Yellow Fever Commission" of the National Board of Health, Cor. Member of the Epidemiological Society, London; F. R. M. S., etc.

WHAT IS MALARIA?

Evidently malaria means bad air; but there are many kinds of bad air. Is this then a general term used to indicate that the atmosphere is contaminated with something not found in pure air, and that, consequently, it is bad?

If so, the sulphurous vapors from the "lead factory"—reduction works—in view from my front window, which impregnate the atmosphere and cause me to cough, when the wind is from the south, are malarial; and the horrid stench from the bone-boiling establishment, which I must pass in going to the "Presidio," is malaria of a very offensive and disgusting kind. But my health does not suffer from the occasional doses which I take of this bad air, and the workmen at these establishments, who respire it habitually, seem to be lusty fellows. As it is generally understood that "malaria" is something which undermines the health and calls for a prescription from the family doctor, it is apparent that bad air which does no harm must be excluded from the definitions when we are prepared to give it, and that the disagreeable varieties of bad air referred to, come under the general head of "nuisances" and not under that of malaria. But what shall we say of our gentlemen patients who stick out their furred tongues at us with a grimace and a shake of the head, saying, "I don't know what's the matter with me, doctor, but I feel dull, have a slight headache, and no appetite worth speaking of (especially in the morning), for breakfast; I expect it's malaria?"

If we wish to be in fashion, and not to offend our patient, we may confirm his diagnosis and give him a dose of "quinine." But if we don't mind being disagreeable and can afford to take the chance of losing a patient, we may inquire how many cigars he smokes every day, how many glasses of champagne, lager beer, or whatever may be his favorite tipple, he drank the previous evening, etc., before we commit ourselves to a diagnosis.

So too when a lady patient complains of "malaria" there are certain questions as to the temperature of her sitting-room, the amount of exercise she takes, etc., which the conscientious physician thinks it necessary to ask, before deciding that her aches and pains are malarial.

If the fashionable "malaria" is not always due to bad air, surely it is vitiated air in illy ventilated school houses, churches, etc., which gives rise to the uncomfortable feelings which are experienced by one who is compelled temporarily to respire the atmosphere of such a place, crowded with human furnaces, each giving off the products of combustion into the confined space; and to the languor, loss of appetite, headache, etc., complained of by the unfortunate victims who are required to respire such an atmosphere for several hours daily.

Yes, this is bad air, poisoned air, and noxious enough to be called by a Latin name; but it is not *malaria* under the restricted signification which by common consent is given to the word in order to designate a special kind of bad air.

The kind of bad air which is given off, most abundantly from marshy grounds, and *which is the cause of that* class *of fevers known* as "*paludal*" (*palus*, a marsh) or "*malarial;*" *the most important distinguishing characteristic of which* is *their paroxysmal character* intermittent, or remittent. But having made this definite statement let us hasten to say that malaria may be given off from ground which is not marshy; that not all marshy ground produces malaria; and that malarial fevers are not always paroxysmal.

The critical reader may pause here to remark that after considerable beating about the bush we have a definition of malaria—in italics—which tells us in a general way whence it comes and what are its effects; but that the question, *What is malaria?* don't seem to be answered. The justice of this remark is admitted and at last we are forced to the definite answer—*We don't know.*

While it is always humiliating to confess ignorance, it is, nevertheless, the first step to take if we really wish to be enlightened. For the assumption of knowledge which we do not possess, or the method, not entirely obsolete, of stating our want of knowledge in high-sounding words arranged in the form of a definition, cannot fail to check investigation, and, indeed, has always been a most patent barrier to scientific progress.

There are those, however, who claim to know exactly what malaria is; and to justify our confession of ignorance it will be necessary to show that these claims are not well founded, or, at least, that the evidence presented in their support is not sufficient to entitle any one of them to acceptance as a satisfactory and final answer to the question, What is malaria? These claims as to a precise knowledge of the nature of malaria, will be discussed in a subsequent paper.

The remainder of the present article will be devoted to a summary statement of known facts relating to the origin, distribution and effects of the malarial poison.

And first it may be stated that the poison is known only by its effects upon man and the lower animals (?).

"Common intermittent fever, usually of the tertian type, has been observed in horses, cows, dogs and hogs" (Hertz, in Ziemssen's Cyclopædia of the Practice of Medicine, Vol. II, p. 587.

These effects vary in intensity from slight indications of ill-health, such as lassitude, digestive derangements, headache, neuralgic pains, etc., through the various types of intermittent and remittent fever, up to the malignant and often fatal forms of poisoning known as "pernicious" fevers.

Physicians are also generally agreed that other diseases due to a distinct—specific—cause may be complicated by malarial poisoning, which influences materially the progress of the malady, or even, as some claim, gives rise to a hybrid disease, *e g.*, the so-called typho-malarial fever.

Malarial fever, *per se*, is rarely a fatal disease in the northern portions of the United States; but the malarial poison is nevertheless responsible for a very considerable proportion of the mortality which occurs in the extended areas over which it is evolved in greater or less amount.

For continued exposure to its action undermines the general health and renders the subjects of this kind of poisoning less able to resist the effects of more potent poisons, such as that of typhoid, yellow fever, diphtheria, etc.

As we go further south the mortality tables furnish us evidence of increased potency, and in certain localities in the tropics the malignancy of this poison, as shown by the rapidity with which it kills, is not second to any of those mentioned.

Here, then, is one factor—*heat*—in the production of malaria the influence of which cannot be questioned.

Two other factors are also necessary, viz.: moisture and the presence of organic material of vegetable origin. It is easy to demonstrate that all of these factors are essential, and that no two alone can produce malaria. Thus we have heat and moisture, but no malaria, at sea in the tropics. We leave bales of hay or sacks of grain exposed to the rays of a tropical sun for any length of time without producing malaria so long as they remain dry. And in extreme northern latitudes organic material of vegetable origin may be saturated with moisture for months without any malaria being produced. But in tropical swamps we have all of these factors combined and here we have evidence of the presence of malaria in its most potent form. Of course, in speaking of *heat* as a factor, we refer to a definite range of temperature, within which, the other conditions being present, malaria may be produced.

Now, the conditions under which malaria is evolved, are exactly the conditions favorable for the decomposition of organic material, and, as a matter of fact, malarial emanations may usually be traced to localities where *vegetable* material is undergoing decomposition.

This is not necessarily in swamps only; but, as well, in damp bottom-lands, in imperfectly drained uplands, and in general, wherever vegetable material is exposed to decomposition under the influence of warmth, moisture and *air*. For here is an additional factor. Vegetable matter, even if moist and exposed to the proper temperature, does not decompose rapidly unless liberally supplied with oxygen. For this reason it may accumulate at the bottom of ponds, or in the soil, where this is not disturbed and there is a luxuriant vegetation. If, now, the bottom of the pond is exposed, or the soil is turned up by the operations of the engineer or the agriculturalist, decomposition proceeds rapidly, if the temperature be favorable and there is sufficient moisture, and under these circumstances malaria *usually* manifests its presence in a very decided manner.

On the other hand extended experience proves that, as a general rule, the effects of malaria are less manifest exactly in proportion as marshes and low damp soils are drained and cultivated, or permanently flooded with water.

There can be no doubt with reference to the influence of the factors named in the production of malaria. But we have been obliged to qualify the general proposition that these factors produce malaria, by the word *usually*. For there is good authority for the statement that these factors do not always give rise to malarial emanations. Thus Hertz says, "Malaria may be found in the mainland of Australia, though in a mild form. It assumes a severe type on some of the smaller islands, as the New Hebrides and the Society Islands, and, strangely enough, *is entirely unknown on the Sandwich Islands and the Samoan Islands as well as the island of New Zealand and Van Diemen's land, in spite of their marshy ground and frequent inundations.* (*l. c.*, p. 563.)

How shall we account for these remarkable exceptions to the general rule? First, we might inquire as to the truth of the statement. For statements of this kind, published in encyclopædias, cannot always be accepted without question. But accepting this, let us see how much weight should be given it, and whether the facts can be reconciled with those already given.

First, we note that New Zealand and Van Diemen's Land, where malarial fevers do not prevail, are between 35° and 50° south latitude, while the New Hebrides and Society Islands are twenty degrees nearer the equator. The facts, therefore, conform with what has been observed in the northern hemisphere, as the greater part of New Zealand and all of Van Diemen's Land, is beyond the latitude where malarial fevers are most prevalent. This is not true, however, of the Samoan and of the Sandwich Islands. These islands are all of volcanic origin and the largest active volcano in the world—Manna Loa—is upon one of the Sandwich Islands. Possibly this has something to do with the exemption which these islands are said to enjoy from malaria. This view is sustained by facts recently brought to the notice of the French Academy of Sciences in a communication by M. d'Abbadie (*Comptes Rendus, t* XCV., p. 497-500.)

This author having learned that certain elephant hunters in intensely malarious regions in Africa, enjoyed an immunity from the effects of the poison which they attributed to daily fumigations of the naked body with sulphur, undertook an investigation for the purpose of ascertaining whether "sulphurous emanations received involuntarily in places where malaria prevails, preserve the health of the inhabitants." The evidence collected is decidedly in favor of the view that such is the case.

The general statement that malaria is most abundantly generated in marshes—fresh or salt water—and in low, damp grounds, is not invalidated by the fact that it may also prevail in mountainous regions and in places where the soil is superficially dry. A loose surface soil, overlying an impervious stratum of clay or rock, permits the air to penetrate to this stratum, where the water which accumulates after a rain may be retained in depressions, and we have thus all the conditions necessary for decomposition of the vegetable matter which may be present in the soil, and for the evolution of malaria.

[TO BE CONTINUED.]

HEATING AND VENTILATION OF THE BRIDGEPORT HIGH SCHOOL HOUSE.

The heating and ventilating of the new school building at Bridgeport, Conn., have previously been described and discussed in THE SANITARY ENGINEER, particularly in the issues of July 1, 1880 (Vol. III., page 294) and Dec. 1, 1881 (Vol. V., page 4). Since the occupation of the building in October last, it has been visited and examined by several prominent heating and ventilating engineers and others who desired to observe the practical operation of the plan.

One of the most extensive of these examinations was made by Dr. D. F. Lincoln, of Boston, on the 22d and 23d of December. From the notes of our representative, who was present in the afternoon of the first day, we give a report of the thermometrical and other observations then made, to which is added a report of the observations on the following morning from notes furnished us by Dr. Lincoln himself.

The room selected for examination was that in the northwest corner, on the third floor, which was unoccupied, except by eight or ten gentlemen present to assist in

Digitized by Google

or witness the observations. The school rooms, it will be remembered, are all of the same size, 26 ft. x 38 ft. (or a little larger in the upper stories as the thickness of the exterior walls decreases) and 13 ft. high, giving about 13,000 cubic ft. of air space, and heated in the same way. Briefly, the peculiar feature of the system is the introduction of fresh air at the inner corner of the room, opposite the outside walls, instead of at the outside walls as is customary, and the removal of the foul air at the same corner, directly under the inlet. The latter is about eight feet above the floor and measures 20 inches by 28 inches, or, deducting one-third for the scroll grating of the register, having an area of about two and one-half square feet. The outlet is beneath the teacher's platform (which is raised several inches above the floor on castors to allow its easy removal for cleaning under it) and is five feet in area, unobstructed by a register. The outlet opens directly into a large central brick exhaust shaft in which is carried, in metal flues, the fresh air to each room from heating coils at the base of the shaft, the loss of heat from the inlet ducts being thus utilized to create a draft in the

exhaust shaft. When artificial heat is not required and fresh air is introduced through the windows, the inlet register may be used as an outlet by closing a valve below it and opening another into the exhaust shaft. While hot air is being admitted the room is closed, special pains having been taken to make the windows tight by carefully fitted casings with the addition of weather- strips. There are six windows in each room, as shown in the accompanying plan—three, close together, in the rear and as many on one side—the scholar's left hand. The glass surface of each measures eight feet by three feet, two inches, the bottom being four feet above the floor. The outer walls are of solid brick of unusual thickness and the interior surfaces have a fine "sand finish."

The large opening, shown in the plan, at the left of the platform is into the assembly room through folding doors and the smaller one on the right into the hall. The circles on the plan indicate the position of thermometers and the numbers beside them are those used in the table below. Where two numbers are attached to one circle, there were two thermometers, one above the other. No. 1 was at the centre of the hot air register—about eight feet above the floor; Nos. 2 and 3 at a height of 12 feet above the floor (about as high as the instrument could be placed in a vertical position); Nos. 4, 5, 6, 7, 8, 9, 10 and 11 at a height of five feet, six inches—level of bulb; and Nos. 12, 13, 14 and 15 at one inch above the floor, No. 15 being in front of the outlet.

Number of Thermometer on Plan.	December 22, P. M.					Dec. 23, A. M.		
	2 h. 40 m.	2 h. 50 m.	3 h. 10 m.	3 h. 25 m.	4 h. 0 m.	9 h. 0 m.	9 h. 40 m.	10 h. 7 m.
1	108° F	112°	120°	120°	119°	90°	104°	135°
2	74	76	80	81+	84	.....	70	80
3	75	78	84	85	87	.....	67	79
4	69	70	73	75	76	61	63	68–
5	69	71	74	76	77	61	63	69–
6	69	71	74	75	77	60	62	69
7	71	73	76	78	79	60	63	72
8	68	70	73	75	.....	.....	.....	.....
9	70	72	76	77	78	60	62	71
10	69	71	75	76	78	60	63	69
11	70	72	76	77	79	61	63	70
12	67	67	.....	70	.....	.....	.....	.....
13	66	67	70	.....	.....	.....	60	62
14	65	65	.....	69	69+	57	59	60
15	68	69	71	73	.....	.....	61	64
Outside	.....	37	.....	36	.....	41	.....	.....

The thermometers used were said to have been carefully selected and compared with each other and to have had no great variation. The room had been closed (before the afternoon observation) at 12.40. A class of about fifty scholars—the full number—was admitted at three o'clock and dismissed twenty-five minutes later.

Two measurements were made of the amount of air coming in. The first at about 2.50 showed nearly 800 cubic feet per minute and the second at 3.15 nearly 1,000 cubic feet per minute, or 20 cubic feet per pupil.

In the words of Dr. Lincoln, "abundant proof was given that the current passes very rapidly across the ceiling, quickly down the exposed (outer) walls, then slowly back across the room to the outlet; the range of temperature, regularly falling in about this order, furnishes a proof of this, and further evidence was fu'ly given by the action of anemometers at ceiling and at the outer, exposed faces of the room. *In the latter situation, the current was invariably downward*, and the elevated temperature at the windows will be noticed.

"To answer a question as to the temperature at the level of the pupils' bodies, a thermometer was placed upon a desk at 14. In the last two trials (right-hand columns) the readings of Nos. 3, 9, the new thermometer and 14, (respectively placed at the ceiling, at 5½ feet from floor, at the desk level, and at the floor) were 67°, 62°, 60°, 59°; and 79°, 71°, 63°, and 60°."

Correspondence.

THE VENTILATION OF ELEVATED RAILWAY CARS.

To the Editor of THE SANITARY ENGINEER:

Your sterling method of treating sham sanitation, and exposing the absence of needed sanitary appliances, where the public are interested and have a right to demand them, leads me to call your attention to the imperfect ventilation of the cars on the Sixth Avenue Elevated Rail Road.

A short time since the atmosphere of the car in which I rode being more than ordinarily foul, I inquired of the conductor the reason, and was informed that during cold weather the cars were never aired while in use.

If the conductor's statement was accurate, are not the railroad authorities culpable for this neglect of duty toward the public? HARLEM.

[We have ourselves experienced the discomfort to which our correspondent refers; but we can hardly credit the statement of the conductor. Certainly, opening the windows and doors of every car for two minutes at each terminus of the line would completely change the atmosphere of the car, and would go far toward remedying the evil complained of.

We believe, however, that the railroad company owes it to the public, for whose convenience, primarily, it exists, and upon whose patronage it depends, that the most approved system of ventilation should be adopted and applied to their cars.]

REMOVING SNOW FROM SIDEWALKS.

BOSTON, *Dec.* 26, 1882.

To the Editor of THE SANITARY ENGINEER:

I noticed in a yard recently, at a time when the ground was covered with snow, a long strip of bare ground, and, on examination, discovered that underneath it was a steam pipe running between two buildings. The idea came to me that a coil of pipe placed under a sidewalk and connected with the boiler of the adjacent building, might prevent the formation of ice thereon, in winter, and so save the trouble of removing snow and ice, and often prevent serious accidents. Of course, the coil need be connected only during storms and cold weather.

[In practice it would be found much cheaper to pay a person to thoroughly remove the snow than to maintain an apparatus such as you propose and pay for the coal required to do the duty in this connection. We refer you to an article on page 231, Vol. IV., which will give some idea of the cost of removing snow by the use of steam.]

APARTMENT HOUSE BOILERS.

To the Editor of THE SANITARY ENGINEER:

DEAR SIR:—Will you please explain how the expansion pipes and supply tanks are arranged for the boilers in your high apartment houses? As I understand the street pressure does not rise above the second floor, and some of the new buildings are said to be ten stories, how are the boilers in the upper floors arranged? Particularly I want to know whether there is one tank in the top of the house for all the boilers, or whether there is a separate tank, or tanks on each floor for the boilers on that floor. If a single tank on top is ever used, I want to know whether lead pipe is strong enough to withstand the great pressure at the lower boilers, or what metal is generally used for the pipes, both supply and expansion pipes; also how the expansion of so long lines of pipe is allowed for. You would oblige if you would illustrate these points from some of your large jobs.

[In the high apartment houses referred to the hot water is supplied to the different floors from a hot water tank in the basement; this is fed by cold water from a tank on the top floor or roof of the building. The water is heated by a steam coil and complete circulation is maintained. The pipe generally used in this city is wrought iron galvanized. We shall describe and illustrate this feature in an early issue.]

JOINTS ON SOIL PIPES.

BOSTON, *Dec.* 20, 1882.

To the Editor of THE SANITARY ENGINEER:

I find great difficulty in getting caulked joints of cast iron soil pipe to stand the test of atmospheric pressure. Many joints, as they are usually made by the plumber, will stand the pressure of a considerable head of water, but air under pressure passes through. Would you kindly inform me if a flange joint secured by bolts, and having a packing of paper or leather covered on both sides with red lead or other good cement, or putty, would not make a *tighter*, stronger and surer joint for soil pipe connections within houses?

Fig. 1 *Fig. 2*

As for the question of the economy of such flange joints, both as to space and cost, what relation should you judge them to hold with the ordinary caulked joints? The extension *a b*, *a'*, *b''*, in the flanged joint, Fig. 2, might be omitted. Would such an omission in practice be likely to occasion misfits? Very truly yours,

SUBSCRIBER.

[The joint you propose might stand a greater test than the average lead caulked joint, but in many situations it would be impracticable to make it. There is no difficulty, in our judgment, in securing lead caulked joints that would be tight against any possible entrance of drain air. Under what circumstances an atmospheric pressure, such as you refer to, could exist in any ventilated system of drain pipes, we are unable to conceive.

The joints you propose would cost at least double in labor. The iron founders would have to make an entire line of new patterns; each flange would require to have its face filed off true and smooth; any attempt to screw up the bolts when the slightest variations occurred would result in splitting the flange. If your plan were adopted at all, it should have the projections *a a* as you suggest, but we can see no valid reason why the expense should be incurred to carry out this suggestion.

It is quite true that lead caulked joints are frequently not tight, but this is due to careless and inefficient work—the pouring in of the lead too cold and the lightness of the ordinary iron pipe. It is feasible and possible to caulk joints on the ordinary pipe for a three-story house so that they will stand the ordinary water tests, but for higher buildings and longer runs it is hardly possible to do this without splitting the hubs. If we were writing a plumbing specification we should always call for the extra heavy pipe; with this joints can be caulked to stand any pressure they would ever be subjected to, and the difference in price is money well invested. With what is now known as the "extra heavy pipe," there is no excuse whatever for leaky joints. And if it was understood that each piece of work had to stand a test, the work would be properly done.

On this question we would like to present the opinions of our plumbing readers.]

A PLUMBING SPECIFICATION.

HARTFORD, CONN., *Jan.* 2, 1883.

To the Editor of THE SANITARY ENGINEER:

Inclosed is a specification of plumbing and gas-fitting for an office and residence of an eminent physician.

The water supply is not constant; the sewer is about 200 feet away from the house.

The inlet is designed to be surrounded by shrubbery for concealment, and the absorption of any gases that may escape.

The two soil pipes are carried up in vent-flues of chimneys; would it be safe to carry them in smoke flues?

The house measures about 60x70 feet, and is entirely isolated, and surrounded by trees. The rain-water leaders are discharged into rock pits, and thence into the light sandy soil.

Digitized by Google

All the work is constantly under the eye of a competent superintendent. The gas-fitting notes are taken from Prof. Clarke's specification in the *American Architect.*

Will you please criticise. Q. V.

PLUMBING.

Fixtures in Basement.—Water closet. Supply to wash boiler. Set of three wash-trays. Sill cock.

First story.—Kitchen sink. Pantry sink. Bath boiler. Water closet. Two wash bowls.

Second story.—Two bath tubs, two water closets, six wash bowls. Slop sink.

Attic.—Tank.

The two soil pipes to be heavy wrought iron, 4", lead, calked joints, tarred inside and out. They are to be carried on an even pitch in basement, and the east pipe will be suspended from ceiling until pitch interferes with head room, when it is to be carried to trench and carefully aligned on a red cedar board, the ground having been previously well rammed and puddled. A 4 x 4 x 6 Y-branch will connect the two pipes, and the heavy 6" tarred iron soil pipe will be carried outside of foundation walls, where it will be tightly connected with earthenware drain.

Inlet.—Sixteen feet beyond rear of house place a 6" glazed earthenware (Akron) trap in a tight square well, 2' 0" x 3'0" with cemented walls and concreted bottom. Insert a tarred 6" iron inlet pipe into a quarter bend on house side of traps and secure with oakum and cement. Cast iron ventilating cap.

The mason builds the well, concretes it, and covers with flag-stone, and lays the drain (6" glazed Akron) from trap to sewer in Ninth street. The plumber is to furnish, set, and be responsible for all the rest.

The soil pipes are to be carried 6" above top of chimneys with end glazed.

Water closets.—In basement, a flush rim crockery hopper. Henderson's flushing valve, operated by seat. Tank 1' 0" x 1' 0" x 2' 0". Ball cock and overflow. Lined with 14 oz. tinned copper.

Coat room and dressing room water closet, Hellyer's short, flush rim hopper and trap with tank complete, operated by seat. Preliminary flush.

For each seat furnish one Italian marble dished slab, with back and side strips 4" high. Front edge ogee moulded.

Strip of copper dressed around top of bowl to make tight against marble seat, with vent connected with 2" ventilating pipe from trap.

The seat of bath room water closet will be of wood, but the water closet will be the same as other two.

Wash bowls.—Best marble 15", all supplied with hot and cold water. 1½" 3-lb. lead waste with trap, and 1½" vent pipe therefrom carried separately to a point above other fixtures where all vent pipes are connected with soil pipe. The three bowls remote from soil pipes are ventilated at centre of cornice with glazed ends.

The brass soldering ferrules for all connections of lead into iron wastes, 1¼" dished slate white Italian marble 12" back and side strips where needed; free edges ogee moulded.

Bath tubs.—16 oz. planished and tinned copper; 2" lead pipe waste and S-trap 1½" vent. Tube 5' 6" long.

Slop sink.—Mott's 22" x 20" x 12" round corners, enamelled iron, with overflow.

Pantry sink.—Tinned copper oval; 16 oz. drainer of corrugated copper not tinned. Entire shelf coppered with 14 oz., turned up 3" all around. 6" round trap of 6 lb. lead.

Kitchen sinks.—24 x 48 wood, lined with 20 oz. copper, with brass strainer and soap holder. 6" round trap. 6 lb. lead; air chamber to pipes over sink.

Wash trays.—Three of Monahan Ceramic Co.'s, one with rubbing board, plugs, chain, soap-holder, etc., complete, one 6" round lead trap for the three trays.

Clothes boiler.—Furnish and set 25 gal. 22 oz. tinned copper with steam pipe connecting with flue.

Tank.—Line with 16 oz. tinned copper, size 2' 0" x 3' 0" x 4' 0".

Provide with ball-cock and ball-overflow; bath boiler valve and self closing ⅝" cock for drawing water in attic, all heavily soldered and finished in the best manner.

Bath boiler. Eighty gallon, warranted copper; iron stand; 1" brass pipe to water back; sediment cock; ¾" —2¾ lb. circulating and expansion pipes.

All overflows are to be carried below water line of trap.

All fixtures are to be ventilated with galvanized iron pipes extending to outside air away from windows or into soil pipe above highest waste pipe.

Wash basins, baths, kitchen and pantry sinks, 1½" vents, remainder 2".

All cocks (compression on wash bowls), chains, plugs, etc., to be nickel-plated heavily.

All bowls, baths, sinks and wash trays connected with hot and cold water.

Supply.—Run a 1¼" enamelled iron pipe from cellar wall direct to tank in attic. Take off 1", 3 lb. lead branch to range, kitchen and pantry sinks. Supply all other fixtures direct from tank in attic by 2½ lb. lead ¾" pipes, ¾" cocks to bath tubs, slop sink and wash trays. ⅝" cocks to kitchen and pantry sinks and wash boiler. ½" cocks to wash bowls; provide strainers, plugs and chains to these and bath.

All lead pipes between floors to be laid on boards, with proper and even inclination to drain off water; thoroughly put up with tacks.

All joints wiped except wastes under basins.

Furnish and do all as intended by plans and specifications, and as directed by the architect to complete the whole, a first class job in every respect.

Add.—All piping where possible to be visible except in main halls, parlor, sitting room, main office, dining room and second story chambers.

(Apply peppermint test and leave all perfect.)

[The placing of soil pipes in vent flues or smoke flues is decidedly objectionable, for the reason that they will be inaccessible.

The discharge of rain water into rock pits and thence into soil is also objectionable if near the house.

The terminus of soil pipe should not be near the top of a chimney; at certain times there is likely to be a down draft.

The provision "all fixtures are to be ventilated with galvanized iron pipes extending to outside air, away from windows or into soil pipe above highest waste pipe" is dangerous, for as we understand from a sketch accompanying the specification this ventilation is intended for the space surrounding these fixtures. If we are correct in this assumption the effect of connecting the pipe to the soil pipe would be to provide means for bringing the soil pipe air into every apartment in which a fixture so connected is placed. Such pipes should always be run into a heated flue or carried to out of doors with a gas jet in them to induce a draft. Vents from traps are the only ones that should be branched into a soil pipe as here called for.

Finally as a specification this is quite incomplete, since it only states what kind of fittings are wanted, and does not describe in detail the character of the work. It might do if the work is to be given to a first-class plumber without competition, but if let out to several parties to estimate on it will be difficult to secure under it a strictly first-class job, if the cheapest man gets it.

We suggest that the form of specification furnished by the New York Board of Health be used and filled out as required.

We have omitted the specification for gas fitting.]

THE PEPPERMINT TEST.

WILMINGTON, DEL., *Jan.* 2, 1883.

To the Editor of THE SANITARY ENGINEER:

Will you please be good enough to inform us how what is known as the "Peppermint Test," is applied to pipes in testing for leaks? We often see it referred to in THE SANITARY ENGINEER, but have never seen any description as to how it was done. Has it ever been described in THE SANITARY ENGINEER? We will be obliged if you will give us the information. Yours respectfully, A. S.

[It has frequently been described in THE SANITARY ENGINEER. It consists in having a person pour the contents of a two ounce vial of oil of peppermint down the soil or waste pipe from the highest fixture, (or open end of the pipe above the roof), following it with two or three gallons of water so as to convey the peppermint the entire length of the drain. Another person examines the drain pipe or soil pipe, from the cellar wall up through the house. If there is an opening anywhere the smell of peppermint will be plainly perceptible.

In making this test great care must be taken that the person handling the peppermint spills none of it about the room or on his person; otherwise the smell will pervade the house even though the pipes are perfectly sound. For this reason practical sanitary engineers recommend that the peppermint be poured into the open end of the pipe above the roof, and the person pouring it stay on the roof until the test is completed.]

A correspondent of *Cotton, Wool and Iron* relates the results of tests made by him on several coverings for boilers. Three kinds were used; first one is covered with fine ashes made level and then a course of bricks on top; the second one is asbestos; the others are covered with sour flour, plaster of paris and fine ashes, mixed the same as mortar. Tested by a thermometer the results were as follows: Each boiler was subjected for 30 minutes to 70-lb. steam pressure. Fine ashes and brick, temperature, 114°; asbestos, 126°; sour flour mixture, 123°. One more test was made as follows: Steam pressure, 84 lbs. No. 1, ashes and bricks, 107°; No. 2, asbestos, 112°; No. 3 boiler, sour flour mixture, 110°.

PLUMBING VIOLATIONS.

Eight violations of the plumbing law were reported last week to the Health department of this city by Inspector Hooper and two by Inspector Golden. Most of them are not of a serious character.

A FICTITIOUS ENDORSEMENT.

PHILADELPHIA, *Jan.* 3, 1883.

To the Editor of THE SANITARY ENGINEER:

Enclosed you will find drawing which I cut out of paper published in our city, and would like to have you answer through your valuable paper whether you do or do not endorse such ventilation as he claims; it will surely freeze the trap and pan, and if the closet gets stopped, the soil will run down the side of the house. You will also see he was presuming enough to send a communication to our City Council. Yours respectfully,

W. E. LINDSLEY.

The inclosures are as follows:—

"A sub-committee of the Councils' committee on surveys yesterday met to consider a communication addressed to Councils by L. O. Howell, a sanitary plumber, advocating the passage of a general ordinance to compel the proper construction and ventilation of sewer connections. Mr. Howell was present and explained some of the dangers and defects of the present system, illustrating his remarks by plans and drawings, showing properly and improperly constructed systems of house drainage."

L. O. HOWELL, JR.,

PRACTICAL SANITARY PLUMBER.

2013 COLUMBIA AVE.

No more Typhoid or Malarial Fevers by using my System of Ventilation.

The above cut represents my Patent System of Ventilation, which has been indorsed and recommended by THE SANITARY ENGINEER.

[We have never seen this patent, do not know what its claims are, neither have we in any way whatever either recommended or endorsed it. Mr. Howell's use of our name in this way in an advertisement is an imposition, and entirely unwarrantable.

If this sketch indicates his idea of the proper way of ventilating soil pipes, he is astray. To have a water closet as the termination of a soil pipe is about 10 years behind the times, and is no longer tolerated where any plumbing regulations are enforced. There is no objection to the pipe *B* to ventilate the receiver, but that can hardly be patented, since it has frequently been done heretofore. It is cheaper and better to abandon a pan closet than to incur the expense of this vent pipe for the sole purpose of removing the foul smells from its nasty container.

The attempt to induce the Councils of Philadelphia to pass an ordinance to control plumbing work is commendable, and we noticed the movement with favor some weeks since, but we never endorsed any patented system, or imagined that any was considered. In fact, the rules of the New York Board of Health are good enough for Philadelphia, with some slight modifications in the details to suit local conditions, and there are no patents to bother about either.

Our correspondent has our thanks for calling our attention to this matter, and Mr. Howell is requested to at once withdraw our name from his advertisements.]

Three men who sold a beef carcass, which was unfit for food, to a Rochester hotel, were recently sentenced to a fine of $50 each or 30 days' confinement in the penitentiary.

E. G. LOVE, Ph.D., *Gas Examiner.*

AUTOMATIC CUT-OFF FOR GAS.

The apparatus here illustrated has been devised by H. Michaelis, and thoroughly tested in the Pharmacological Institute of the University of Berlin. It cuts off the supply of gas at any previously-determined time within the next twelve hours, and therefore puts out all lights connected with it.

The apparatus looks like an ordinary clock, which may either be placed upon the table or suspended from the wall. By means of rubber tubing it is connected with the

gas conduit; the clock is wound up, and the special alarm hand, which is situated upon the face, set upon the exact hour and minute at which the supply of gas is to be stopped. When the proper moment is reached, the turning of the alarm wheel shuts off a stop-cock situated in the gas pipe passing through the clock. At the upper part of the case, there is a slit from which projects a lever connected with the stop-cock, by means of which the latter can be turned on and regulated, independently of the clock work.

Although the apparatus is primarily intended for ordinary coal gas, still it may be used also for other gases, as long as they do not attack brass. It may also be used for the automatic stoppage of gas motors or gas engines.

The apparatus may be obtained from F. L. Loebner, manufacturer of clocks, Berlin, Potsdamer Strasse.—*New Remedies.*

The *American Gas Light Journal* contains a paper read before the society of Gas Lighting by Mr. A. M. Smith, in which are embodied the results of some tests made with the Siemens burner. Three burners were tested, and it should be stated that they are especially adapted to the use of high candle-power gas. A 500 candle burner with a consumption of 51 feet per hour, gave the lights of 505.8 candles, or 9.91 candles per foot. This was the highest result obtained. A 200 candle burner consuming 27 feet per hour, gave the light of 208.5 candles, or 7.72 candles per foot. The best results obtained with an 80 candle burner, was 86.34 candles with 14.28 feet consumption, or 6.04 candles per foot.

Dr. Foerster, Director of the Imperial Standard commission of Germany, criticises the rules for testing petroleum as given in the English Petroleum act of 1879, in that no account is taken of atmospheric pressure. He mentions two cases in which the oils tested in London with the barometer at 29.80 inches gave flashing points of 89° and 74° F. respectively. These same oils when tested at Buxton with the barometer at 28.35 inches gave 86° and 72° F. The influence of atmosphereric pressure upon the flashing point of oils cannot be considered as settled until more exhaustive experiments have been made. Different observers would get different results, even at the same pressure, and while there are so many sources of error in the testing of petroleum, it seems like an unnecessary refinement to correct for the varying pressure of the atmosphere.

ELECTRIC LIGHT NOTES.

Articles of Association of New York and Brooklyn Electric Light Company were filed Dec. 29; capital $25,000.

The Electric Supply Company, of San Francisco, has filed articles of incorporation, capital $60,000.

A Mr. Hannahs, patentee of the elevated railroad which is now seeking a grant of right of way in the streets of Chicago, has explained to the Council that electricity will be the motive power and will also be used for lighting the cars.

The Engineers' Club, of Philadelphia, have suggested the advisability of holding an exhibition for the progress and products of modern electric engineering, under the auspices of the Club. The matter has been referred to the Board of Directors.

Savannah, Ga., has awarded a contract for lighting the streets to the Brush Electric Light and Power Company for three years at $18,000 per annum. The Company's proposition contemplated the lighting of the entire city by mast lights at different points, each pole to have two or more 2,000 candle power lamps.

We recently noted that Philadelphia obtains $15,000 per year from the tax on electric light, telegraph and telephone wires, of which there are about 10,000 miles in the city. An ordinance has recently been introduced into the Select Council reducing the fees from $15 to $5 per mile of wire per annum for electric lighting, and from $5 to $2.50 per mile per annum for telegraph and telephone purposes. It is estimated this will reduce the revenue from $15,000 to $4,000 per year.

The London *Economist* says of electric light speculation that "even the great parent companies have nearly lost their premiums. Anglo-American Brush £10 shares, which opened the year at 19 and rose to 68, are now but 12½, and all the offshoots are at heavy discounts. Thus, the Scottish Brush, £2 10*s.* paid, are quoted at ¾; the Great Western, $2 10*s.* paid, are ½; the South African Brush, £2 10*s.* paid, are 1; and so on. Perhaps the best commentary on this mania is that last week the London gas companies sold a larger measurement of gas than in any previous week on record, and that their market values have distinctly risen on the year."

The Electric and Gas Exhibition at the Crystal Palace, London, was opened Dec. 13. The electric light installations were not sufficiently complete to indicate what the exhibition will contain in this respect. Among the displays of gas apparatus were a standard lamp of 1,000 candle-power, of the Messrs. Sugg, and a series of suspended lanterns of tasteful pattern of 600 candle-power. Improved lanterns and burners of high lighting power were shown by Messrs. Bray, Messrs. Siemens, and others.

A course of study giving special attention to electrical engineering has been established at the Massachusetts Institute of Technology. It provides for the continued study of electricity instead of the pursuit of other branches of physics, practice in the laboratory of mechanical engineering and the workshops. Students will receive instruction in the physical laboratory in the various methods of electrical testing. Special instruction regarding land and submarine telegraphy, the telephone, electric lighting, and the electrical transmission of power will be given, and the study of acoustics will also be required in view of the art of telephony.

Meter-ites.

The stockholders of the New York Mutual Gas Light Company have voted to reduce the capital stock from $5,000,000 to $3,500,000.

The Duquesne Gas Company of Pittsburgh, Pa., has been chartered with the purpose of furnishing gas to the city.

There have been erected in Philadelphia during the year 300 new lamps, making 12,972 now in use. There was manufactured a total of 2,403,976,000 cubic feet of gas, which is an increase of 200,000,000 feet over previous year.

During a recent meeting of the Philadelphia Gas Trust it was stated that the leakage in 1879 amounted to 460,211,005 feet. In 1881 it had fallen to 315,377,399 feet.

The danger of closing a damper in a stove pipe of a coal stove was again emphasized in Chicago, the 26 ult., by the death of a woman from suffocation, owing to the escape of gas from the stove into the bed-room. The damper had been closed to check the draft when she retired.

The Manchester correspondent of the *Journal of Gas Lighting* says that the demand for gas for heating, cooking and power is greatly increasing. Gas stoves have never been so much sought for as this season, and there is a steadily increasing demand for gas engines. In his opinion the demand for gas for these purposes makes the effect of competition with the electric light for illumination of small importance as effecting the future consumption of gas.

An explosion of gas, almost as violent as that which occurred not long ago in Philadelphia, took place in a wine store in Boston, the 24th ult. A smell of gas was noticed in the afternoon, and in the evening when an employé went into the cellar with a light a violent explosion took place, doing much damage to the stock and fixtures. A Boston builder suggests that the leak was from a street main, which had broken owing to the settlement of the made land in which it was placed.

A singular accident, due to the use of gasoline for street lamps, occurred in Lexington, Ky., the 26th ult. A lamp lighter overturned a gasoline street lamp, the burning liquid covered himself and the horse on which he was riding with flames. The animal ran and threw his rider, who was fatally burned before the flames were smothered.

The question of cheap gas has been so actively discussed in Rio Janeiro as to produce riots in the streets, the mobs smashing the windows in premises where gas was burning. The result of the agitation will be, it is said, the advertising for tenders in the United States and in Europe.

Councilman D. S. Page, of Philadelphia, has prepared a statement showing the profit which the city can realize from the gas works. The net cost of production is put at 90.2 cents, of distribution 26.9 cents per 1,000 cubic feet. With 10 per cent. allowed for loss by leakage, the cost is $1.27 per 1,000 cubic feet. Should the city sell gas at $1.50, he estimates that a profit would be realized represented at 4 per cent., a capital of $23,911,350.

The following figures concerning the illuminating gases of this city are taken from the report of the Gas Examiner for the quarter ending December 30, 1882:

	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.
Average Illuminating Power for the Quarter	23.60	18.68	21.43	25.83	28.74	18.81
Sulphur, grs. in 100 cubic feet.	9.00	21.70	20.50	5.47	3.62	23.32
Ammonia, grs. in 100 cubic feet.....	0 23	6.61	1.36	trace	0 23	10.82
Specific Gravities.....	.630 to .684	.415 to .460	.532 to .568	.750 to .798	.630 to .646	.424 to .432

THE SANITARY SURVEY OF HAVRE.

In the number of this journal for April 13, 1882, p. 401, an account was given of the undertaking a systematic inquiry into the sanitary condition of the City of Havre, France, and of the creation of committees to investigate the sewerage, paving, markets, etc.

The first result of this inquiry has now appeared in the form of an octavo volume of 94 pages, entitled "Commission d' E'tude de l' assainissement du Havre." Rapport général, présenté par M. Edouard Widmer, Ingénieur des Ponts et Chausées, and the conclusions are summarized as follows:

That there should be created at once a system of sewers on the combined system, adopting the principle of "all to the sewer," provided the following conditions are secured, viz.: 1, a sufficient fall; 2, an abundant supply of water; 3, a constant flow; 4, a perfect ventilation. The small pipe system is discussed and condemned as unsuited to the topography of Havre, which must have sewers for removal of rain-fall in any event. The sewers are to be built of brick, about five feet in height, egg shaped, and to have drains above them to keep the streets dry (*i. e.*, for sub-soil drainage). New streets are to be not less than 15 metres wide, and the streets and gutters are to be kept cleaner and more frequently sprinkled. It is suggested that sea water may be used for this purpose, and also for securing flushing of the sewers by means of automatic flush tanks. In the absence of a map it is impossible to understand the recommendations made with regard to the location of the main sewer outlet. It is recommended that each householder and proprietor be required to drain his premises, that all privy vaults be ventilated, that the water supply be increased, the use of zinc-lined cisterns in houses be forbidden, a new abattoir constructed, a better system of inspection of meats and markets inaugurated, a municipal laboratory be established for the control of adulterations of food, and that vaccination be made compulsory.

Digitized by Google

There is little reason to doubt that if the recommendations of this report be carried out, the mortality of Havre, which for the last five years has been at the high rate of 29.2 per 1,000 will be materially reduced, and we shall look with interest to the next steps taken by the authorities, who thus far deserve commendation for their energy and the methods they have adopted to obtain reliable information and expert advice with regard to the sanitary needs of the city.

SEWAGE PURIFICATION.

We have recently received an account of a trial made in the suburbs of Berlin, of a patented process for purifying sewage by a combination of filtration through peat and gravel and precipitation with milk of lime. The inventor is Dr. F. Petri, who is already known as a patentee for a method of disinfecting excremental matter collected by the pail system.

The sewage is first allowed to pass over and through a series of peat beds, by which it is freed from its suspended matter. The peat is said also to absorb the free ammonia, and to act antiseptically upon a large quantity of the decomposing substances. The sewage then flows into channels, where it is mixed with milk of lime and discharges into large settling tanks, where the lime precipitates the remaining quantities of organic matter. After being once more filtered through a layer of gravel, after leaving the basin, to free it from any impurities that may still be left, the effluent discharges into the creek. The chemical analysis shows the process to be a satisfactory one, as far as purification is concerned. But we think that its evidently great expense would bar its successful introduction in all but exceptionally situated towns.

NOTES FROM CHICAGO.

(From our Special Correspondent.)

I met Oscar C. DeWolf, Health Commissioner of the city, this morning. "Yes, I believe it is true," he said, "that I am the first of the sanitarians of the West who called attention to this danger of our people from immigration. Two years ago, and again last year, I labored with Congress, and finally the Illinois State Board took it up, and the result is this somewhat startling array of statistical proofs by Dr. Rauch, the Supervising Inspector of the North-west, in charge, for the National Board of Health, of the work of railroad inspection in the three States, Illinois, Indiana and Michigan. The whole North-West, with Chicago, is vitally concerned in Dr. Rauch's deductions, for 60 per cent. of the immigrants entering the ports of this country pass through Chicago, as the distributing point of the North-West. Even New York, as the great port of entry, is not so concerned as we, because in Castle Garden they close them up, put them on cars in loads like sheep, pass them here, and here they either stay or distribute themselves over the regions beyond. They have quarantine at the sea board; we have none—hence the vast importance of the railroad inspectors. Since the census, two years ago, 100,000 immigrants have been added to Chicago as permanent population, not to speak of the multitudes who stay here with friends on longer or shorter visits, or while the agents here are arranging to forward them on to their distant homes."

"And this, you hold," the doctor was asked, "as the explanation of Chicago small-pox?"

"I hold the fact to be demonstrated by Dr. Rauch. The health department vaccinated here 94,000 people this year. The Poles, for some reason, are dead set against vaccination, as much so as Indiana Dunkards against lightning rods, and this fact has greatly increased the contagion. If the foreign arrivals don't bring it, how do you explain that our own citizens don't suffer from small-pox? That's a settler in my humble opinion."

Electrical undertakings are also coming to the front. The Western Underground Electrical Company began operations this morning, at Wentworth avenue and the southern limits, and expect to extend their tunnels northward to the heart of the city, so as to supply the same with light by May 1. Branch lines all over the city are outlined. The Company gave up for a bad job its proposed ordinance increasing the size of its tunnels in places from two feet square to three feet wide and five feet high. By a majority of two the Council, at its last meeting, refused a franchise to the Western Edison Light Company, but its application is not withdrawn.

Building operations are very active for the season. Mr. L. P. Leiter is credited with proposing in the spring to build a first rank hotel at Michigan avenue and Congress street. The buildings constructed in the city this year cover about fourteen miles of frontage and cost over $17,000,000. In the same time 36½ miles of streets have been improved, costing $1,100,000, the city's contribution being one-quarter of the sum.

Health Commissioner De Wolf is hesitating between two plans of disposing of the garbage collected in the city, one scheme being to burn it and the other to remove it by train to the country.

Dr. Paton, city physician, is putting in spare time accumulating evidence against suspected violators of the smoke ordinance, which, as a rule, is now being commendably kept.

The Master Plumbers' Association met January 5, some thirty being present; Daniel J. Rock, the President, in the chair. Communications were received from Baltimore and Milwaukee plumbers, asking points for the establishment of plumbers' associations in those cities; also for a brief statement of the advantages arising from organization.

It was decided not to entertain any complaint against members unless it should be formally presented in writing and state specifically the facts in the case, and the complaint handed to the Secretary and by him handed to the Association.

It was announced by Mr. Young, of the Sanitary Committee, that Prof. A Reeves Jackson, of the College of Physicians and Surgeons, would deliver a lecture on sanitary interests, at Fairbank Hall, at a date to be hereafter announced.

In conclusion, the President commended the large attendance, and hoped that all fees would be promptly met, and that the interest in the meetings would continue to grow.

Reviews of Books.

STORMWATER REMOVAL IN TOWNS. With Special Reference to the Sewerage of Berlin.

This is the title of a small pamphlet written by M. Knauff, retired engineer of the Prussian Government, in consequence of the insufficient capacity of the Berlin sewers, shown during several heavy rains last summer. The rain fell at the rate of three-fourth inches in twenty-five minutes, and the capacity of the system is by law proportioned for a quantity of one-third of an inch per hour to reach the sewers.

He advocates a larger capacity for the sewers in the still unfinished districts, and recommends improvements in street-gullies, ventilating man-holes and the removal of the peculiar traps in the rain leaders from houses, (See SANITARY ENGINEER, Vol. VI., p. 444), and also advocates the use of cement for pipe-joints instead of clay and gasket, the present method, on account of the fact that the pipes run at times under pressure.

The larger part of the pamphlet is devoted to a defence of the separate system in general and for Berlin in particular. No arguments that our readers are not familiar with are advanced.

ANNUAL REPORT OF THE SUPERVISING SURGEON-GENERAL OF THE MARINE HOSPITAL SERVICE for the fiscal year 1882: 304 pp. 8 vo., Washington Govt. Printing Office, 1882.

For the year ending June 30th, 1882, Dr. Hamilton reports that 36,184 patients received relief, 13,048 being treated in hospital, and receiving in all 333,475 days of hospital relief. The remainder were treated by prescriptions from dispensaries.

The receipts of the service were $408,215 69, and the net expense of the service was $413,928.14, in addition to $54,199 02 expended for alterations and repairs in hospital buildings. The greater part of the report is taken up with medical statistics and reports of cases, in the number and fullness of which it is a decided improvement upon its predecessors. An appeal is made for the establishment of a national sailor's home for aged and infirm sailors, but we doubt either the necessity or propriety of such an institution.

A brief paper on the hygiene of the steamboats on the Ohio River, by Dr. Wyman, deals rather with the ill treatment received by the deck hands from mates, etc., than with the hygienic condition of the boats, and proposes to have the government "compel the erection of quarters and humane treatment of the crew." On this principle the government would become very paternal indeed; in fact, it is difficult to say where it should not interfere.

REPORT ON DIFFERENT SYSTEMS OF SEWAGE DISPOSAL. By Mr. C. F. Hancock. Presented at the meeting of the Hendon Local Board, held Nov. 25, 1882.

We have received from F. W. Hatch, M.D., Secretary of the State Board of Health of California, THE SEVENTH REPORT of the board from July 1880, to December 1, 1881.

JAPAN, ITS ARCHITECTURE, ART AND ART MANUFACTURES. By Christopher Dresser, Ph.D., F.L.S. Scribner & Welford. New York, 1882.

Construction Notes.

HARTFORD, CT.—The City Council has passed a resolution ordering the street commissioners to report the cost of a stone bridge at the Asylum street crossing.

HAMILTON, ONT.—The Sewer Committee have had plans and estimates prepared for a brick sewer from Strachan street to the bay, to cost $15,000.

PHILADELPHIA, PA.—In Common Council Friday, Dec. 29, the building of new sewers was authorized on 18th street north of Green; on 47th, from Westminister avenue to Weyalusing street. The building of oval sewers was authorized on 22d street, from Chestnut to Sansom, on Marshall street, from Venango to Erie avenue, and on Mountain street from 8th to 9th.

CHICAGO.—The annual report of Superintendent Cheney, of the Sewer Department, contains the following items: Linear feet of sewers constructed, 98,908, or nearly 19 miles. About $175,000 was expended for cleaning sewers, $20,000 for raising catch basins and man-holes, and $5,000 for general repairs. The superintendent will ask for $240,000 next year, and recommend the completion of the 22d and Wallace street sewers and the construction of a sewer on Milwaukee avenue, from Indiana street to the river.

WATERBURY, CONN.—In his message Mayor Kendrick says that the construction of the new sewers will be begun at the earliest practicable moment. The Board of Sewer Commissioners will bring the main sewerage system to as speedy a completion as possible, always allowing for the magnitude of the work and the care necessary to be observed in the undertaking. The main system once perfected, the proper and durable paving of the main streets will follow as a matter of course.

YORKTOWN, VA.—The following bids for the monument were opened at the office of Mr. R. M. Hunt, architect, in this city, the 4th inst.: Daniel C. Hutchinson, New York, $74,000. Mount Waldo Granite Company Works, Frankfort, Me., $74,500. Western Granite Company, Virginia, $74 987 97. Bodwell Granite Bompany, Rockland. Me., E. H. Lowrey, President, $60,436. Hollowell Granite Company, Hollowell, Me., $58,500. David Tilson, Rockland, Me., $60,000. Brown, McAllister & Co., New York, $115,000. Hollowell Granite Company, Hollowell Me., $59,487 if built of Hollowell Granite, $59.939 if built of Westerly Granite, and $5 entra for each letter of the inscription if they are to be raised. E. C. Sargent, of the Concord Granite Company, Concord, N. H., $99,000. The latter's bid was not on the regular blanks prepared for the purpose and was declared informal. The bids will be presented to the Secretary of War and on his judgment the award will be made.

NEW YORK.—The Department Public Works will receive estimates until Jan. 16, for flagging and curbsones on streets around Fulton market.

SAN FRANCISCO.—The Freeholders, at their meeting, Dec. 28, adopted a resolution providing for the insertion of a clause in the charter, which empowers the Supervisors to acquire by purchase, or otherwise, water rights which will make the city independent of private companies.

ALLEGHENY, PA.—James Brown, Comptroller, will receive proposals until January 15 for the construction and erection of one or more pumping engines for the water works.

Digitized by Google

UTICA, N. Y.—The City Surveyor is surveying and preparing plans for a brick sewer through the "Gulf" to South street.

PHILADELPHIA.—The Chief Engineer of the Pennsylvania Railroad, W. H. Brown, will receive proposals for labor and material for masonry and piers for a bridge over the Schuylkill River at Manayunk, until January 15.

DURANGO, COL.—Proposals for constructing water works will be received by F. W. Barnes, Clerk of Board of Trustees, until January 17. Proposals will be received for two systems, gravity and turbine wheel with reservoir.

WATER WORKS OF PRUSSIAN CITIES.

The *Zeitschrift des Königl. Preussischen Statistischen Bureaus*, for the year 1882, contains a report by Dr. Eulenberg on the water supply of Prussian cities from which we make the following extracts.

I. Königsberg. The present water supply of this city was established in 1874, and is collected from the ground water of a belt of sand by means of a canal having an egg-shaped section with a height of 1 metre, a breadth of 0.65 metres, and being 5168 metres long. Its bottom is at an average depth of 4 metres. The ground water collects in this, and flows with a fall of from 1-2000 to 1-3000 into a subterranean collection tube which has a capacity of about 150 cubic metres. From this it flows by gravity through an iron main to a covered reservoir having a capacity of about 4630 cubic metres. From this it is distributed by two mains, one supplying the lower zone of the city and having a head of 30 metres, the other supplying the upper zone through a pump which raises the water 15 metres into a high reservoir of iron having a capacity of 500 c. m. The daily supply is 6000 cubic metres and is at present sufficient, but the projected system of sewerage of the city is carried out, there will be a demand for 22,500 c. m. and other sources of supply must be secured.

II. Berlin is in part supplied by water works and in part by 1133 public wells. The Eastern water works, which take their supply from the river Spree, were constructed by an English company in 1852, and purchased by the city in 1874. The water is purified by sand filters and forced through the mains by steam pumps. There are 11 filter basins with a total area of 37890 square metres. Three of these basins are cleansed each summer. The supply is 3720 c. m. per hour. The Western water works, established in 1877, derive their supply from 23 wells which furnish 1800 c. m. per hour. The total length of the pipes of the two systems was on March 31, 1879, 476036 metres, with 3,474 public hydrants, 14,148 premises with 814,642 persons were supplied, a water metre being attached to each house. The old wells of the city are very impure. Recently a number of iron drove wells, having a depth of about 30 metres have been put down, and the supply from these is thus far good.

III. Frankfort, on the Oder, has water works established in 1872. The water is collected by wells connected by tunnels, giving a supply of between 3000 and 4000 c. m. daily.

IV. In Stettin, water works were put into operation in 1865. The supply is from the Oder—is passed through three filter basins, and then pumped to an iron reservoir containing 3000 c. m. and about 50 metres above the river. The daily supply is r2360 c. m. delivered to 1530 houses.

V. Stralsund has an artificial water supply which dates from the 13th century.

VI. Breslau has water works established in 1871, and which have cost 2,473,164 marks. The supply is from the Oder, and is passed through filter basins from which it flows by gravity to a reservoir. From this it is pumped to a higher distributing reservoir. The daily supply is about 22488 c. m.

VII. Erfurt. The water works were begun and completed in 1875. The water is collected from wells in a sandstone formation, and is then raised to a reservoir about 40 metres above the level of the city, by a series of iron mains 20957 metres in length. The daily supply is about 6235 c. m. The reservoir contains 4000 c. m.

VIII. Kiel. The new water works were opened in the summer of 1880. The supply is from 7 wells and amounts to about 5000 c. m. per day. The supply is constant from a high reservoir containing 2000 c. m.

IX. Frankfurt-on-the-Main. The water works were begun in 1872 and finished in the following year. The supply is from springs and amounts to 600,000 cubic feet per day. The majority of the cities depend upon springs and wells for their water supply, and it is often impure. Iron drove wells are coming into extensive use and are an improvement on the old forms.

It is to be regretted that the report does not include the cost of the water works or any details as to rules and management.

The West Side Relief Association and Seaside Sanitarium has dissolved its corporate organization, leaving balance of funds with the manager, Mr. Henry King, that he may open the Sanitarium again on a private basis. The total contributions for the two branches of the work during seven years have been for Seaside Sanitarium $40.969.-05, and West Side Relief, $25,346.31.

Mr. Wm. Baldwin, Commissioner of Highways of Philadelphia, died of heart disease, Jan. 1.

Mr. Walter Thorn, shore inspector, has received a complimentary letter from the citizens of Gravesend and New Utrecht, for the zeal and efficiency with which he has discharged his duties.

Dr. John E. Addicks, Health Officer of Philadelphia, died suddenly, on Thursday night, at his residence, 1,104 Girard avenue, after but at hour's illness of congestion of the lungs. Mr. Addicks was 70 years of age, and has been Health Officer of Philadelphia for the past twelve years.

The Bordentown, N. J., water works were destroyed by fire, January 2.

The sub-committee of Councils on survey have requested the chief engineer of the survey department to prepare an ordinance for presenting to council regulating house ventilation, sewer connections, etc. The same to be presented at the meeting of the committee on January 16.

NEW YORK TARTAR WORKS AGAIN.

A suit by Sylvester M. Beard against the New York Tartar Company and the Royal Baking Powder Company to secure a perpetual injunction restraining the defendants from conducting the manufacture of cream of tartar and baking powder in their works at the foot of Morton street (Wallabout district) was commenced in Brooklyn last Thursday before Judge Clement without a jury. It is expected that the trial will last for some time and that much medical and scientific testimony be presented. The plaintiff is said to have subpœnaed upwards of a hundred witnesses.

An important decision has been pronounced relative to the removal of a child having an infectious disease to a hospital. Section 124 of the Public Health Act provides that, if it shall appear on a certificate of a medical man that a person is laboring under such a disease, and that the patient is in want of proper accommodation, a magistrate may make an order for the removal of such a person into a hospital. In a recent case of "Booker *v.* Taylor," which arose at Coventry, there was such a certificate and such an order; but the mother of the child obstructed the removal and was summoned for the offence. At the hearing, the magistrates entered into the question of the validity of the order, and declined to convict; and the question being carried before the Court of Queen's Bench, as to whether the magistrates were justified in taking the course they had done, or ought to have convicted, Mr. Justice Field and Mr. Justice Stephen were clearly of opinion that the magistrates had no right to go behind the order, and enter into its validity, and were bound upon the evidence to convict if there had been an obstruction. The Court therefore sent the case back to the magistrates with that direction. —*British Medical Journal.*

Patents.

[It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.]

[Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.]

264,965. EXPANSION COUPLING FOR STEAM PIPES. LEVI SHOOK, Pittsburgh, Pa. Filed July 29, 1882. (No model.) Issued September 26, 1882.

Claim.—1. In a steam-pipe coupling, the combination of the flanged sleeve B, beveled, as at *a*, pipe A, expanded to form the lip *b*, and a metallic plate or washer C covering said lip *b*, and suitable means for clamping the said washer against the face of sleeve B, substantially as described.

2. In a steam-pipe coupling, the combination of flanged sleeve D, having annular rib *e*, gland E, and packing *h* with the pipe A[1], having collar *d* and the spring *f*, substantially as described.

3. The steam-pipe coupling consisting of flanged sleeve B, beveled, as at *a*, pipe A, having lip *b* plate-washer C, flanged sleeve D, having rib *e*, pipe A[1], having collar *d*, spring *f*, packing *h*, gland E, and connecting-bolts, combined and arranged substantially as described.

265,053. FAUCET. GEORGE T. FREEMAN, Whippany, N. J. Filed July 10, 1882. (No model.) Issued September 26, 1882.

Claim.—1. The shank A, door F, link E, and lever D, combined with the cap H, having cylindrical portion *h* and threaded portion *h*[1], and the whole adapted to serve as set forth.

2. The combination of the shank A, as described, the door F, link E, and lever D with the faucet I, having shank I[1], and annular recess *i*, as and for the purposes specified.

265,157. TINMAN'S FURNACE. DAVID M. SHOEMAKER, Columbus, Ohio, assignor to L. S. Ayres, same place. Filed May 31, 1882. (No model.) Issued September 26, 1882.

Claim.—The combination of the body A, the imperforate fire-pot G, having the grates K and H located therein, one above the other, said body being provided with the air-inlets L, located opposite and about the imperforate fire-pot, and the exit-flue D *d*[1], located above the fire-pot, and the intermediately-located shelf and entrance *m*[1], substantially as shown and described.

265,169. MACHINE FOR TAPPING WATER AND GAS FITTINGS. ELIJAH F. SPAULDING, Erie, Pa., assignor to the Jarecki Manufacturing Company (Limited,) same place. Filed Apr. 5, 1882. (No model.) Issued September 26, 1882.

Claim.—1. In a screw-cutting machine, the combination, with the revolving fitting chuck-frame having a ratchet thereon, of the pawl-carrying plate P, pawl *p*[1], connecting-rod K, elbow-lever K[1], chain W, and drum W[1], substantially as and for the purposes mentioned.

2. In a screw-cutting machine having a series of chucks mounted on a revolving frame, and a series of taps and tap-spindles for operating upon fittings held in said chucks, the combination therewith of a carriage, C, yoke C[1] shaft D, and lead-screw D[2], substantially as set forth.

3. In a machine for cutting screw-threads in pipe-fittings, a revolving chuck-frame, A, with a series of chucks, *a a*[1] *a*[2] *a*[3], thereon, in combination with the tap-spindles *b b*[1] *b*[2], the carriage C, lever L[2], and toggles L L[1], substantially as and for the purposes set forth.

4. In a machine for cutting screw-threads in pipe-fittings, a revolving chuck-frame, A, with a series of chucks, *a a*[1] *a*[2] *a*[3], thereon, in combination with the tap-spindles *b b*[1] *b*[2], the carriage C, lever L[2], toggles L L[1], lever K[1], rod K, pawl-carrier P, and pawl and ratchet P[1] R, said lever K[1] being connected to and moving with the toggles, whereby the said chuck-frame is revolved at the same time that the carriage is drawn back, as set forth.

5. In a machine for cutting screw-threads in pipe-fittings, the combination, with the carriage C, which carries the tap-spindles, of a yoke C[1], upon a lead-shaft, the connecting-pin *c*[3], lever *c*[4], pin *c*[5], collar *m*[1], bar M[1], pin *m*[2], collar *m*, and clutch M, substantially as and for the purposes set forth.

6. In a machine for cutting screw-threads in pipe-fittings, the combination with the tap-spindle-carriage and the devices by which it is moved from the lead-screw and made detachable therefrom, substantially as shown, of the levers L[2] L[1] L, drum W, clutch M, rod M[1], and lever O, substantially as shown.

7. In a machine for cutting screw-threads in pipe-fittings, a reversing apparatus consisting of the following elements: a shifting-frame bearing a yoke which engages with the clutch-collar, a swinging lever having one end formed into a whip-spring and connected with said shifting parts, spring catch-bars which engage with said shifting parts, and a cross-head on said swinging lever for disengaging said catch-bars, substantially as shown.

8. In a machine for cutting screw-threads in pipe-fittings, the combination, with the shifting apparatus, of the following elements: the screw *g*, nut N, rod N[1], adjustable tappet-jaws *o o*, pin *o*[2], lever O, and means, substantially as shown, for connecting said lever O with the said shifting apparatus.

265,178. BALANCE GLOBE-VALVE. MARQUIS D. L. SWANK, JASPER T. THORNLEY, and JOHN A. AWALT, Anderson, Ind. Filed Jan. 27, 1882. (No model.) Issued September 26, 1882.

Brief.—The valve I has the apertures I[1] longitudinally through it to allow steam to pass to both sides of the valve, and thus balance it.

Claim.—The balance globe-valve herein described, consisting of the body-casting A B C, having curved arms D and valve-seat *d*, the valve I *i*, having longitudinal apertures I[1], and steam H, working at right angles to the direction of the current, the valve-cap F, having packing-gland *f*, the caps G, packing-chamber E, and operating means *m* M N, all arranged and combined to operate as and for the purposes set forth.

265,194. COCK. MAURICE J. WALSH, New York, N. Y., assignor, by mesne assignments, to Louis Fitzgerald, same place. Filed July 20, 1882. (No model.) Issued September 26, 1882.

Claim.—In a cock, the combination of the barrel A, provided with the ports *h i g j*, and the plug provided with the ports *k l m*, substantially as specified.

265,218. HOSE-COUPLING. CHAS. CHADWICK, Hannibal, Mo., assignor of one-half to Peter B. Groat, same place, and Andrew McNally, Chicago, Ill. Filed June 19, 1882. (No model.) Issued September 26, 1882.

Claim.—1. The combination of the tubular part or barrel A, having on its ends the enlargements or bulbs *a a* and on its exterior surface the screw-threaded enlargements or portions *d d*, in combination with the sleeves or clamps C C, internally threaded to engage the parts *d d*, and having interiors otherwise smooth, and adapted to receive between them and the said barrel a hose or pipe, substantially as and for the purposes specified.

2. The barrel A, having thereon the stop or collar B, the screw-threaded enlargement *d*, and the bulb or enlargement *a*, in combination with the screw sleeve or clamp C, run upon the part *d*, and adapted to clamp or pinch the hose or pipe against the bulb *a* substantially as and for the purposes specified.

265,239. AUTOMATIC AIR-COCK FOR STEAM-HEAT RADIATORS. GILMAN W. BROWN, West Newbury, Mass. Filed July 24, 1882. (No model.) Issued October 3, 1882.

Claim.—1. In combination with the case A and with the furcated compound expansion-bar C, fastened firmly in position at one end only therein, the thimble *c*, secured to the case near its opposite end, and the valve, grooved to receive the free end of the expansion-bar and provided with the guide-spindle extending within the thimble, all being substantially as set forth.

2. The combination of the guide-thimble, provided with the opening at its outer end and the valve-seat at its inner end, with the case, the furcated compound expansion-bar, fastened firmly at one end only in said case at or near one end thereof, and the valve, grooved to receive the free end of the expansion-bar and provided with the guide-spindle adapted to play in the thimble, all being essentially as shown and described.

265,242. EXHAUST-STEAM TRAP. JOHN E. CHAPER, Cleveland, Ohio. Filed June 26, 1882. (No model.) Issued October 3, 1882.

Claim.—In an exhaust-steam trap, the combination of the chamber A with the pipes B and C, substantially as and for the purposes set forth and described.

264,871. BOILER FURNACE. MARK S. FOOTE, Burlington, Iowa. Filed Aug. 8, 1882. (No model.) Issued September 26, 1882.

246 913. MEANS FOR WARMING RAILWAY CARS BY STEAM. WILLIAM H. WARD, Pittsburgh, Pa. Filed Jan. 19, 1881. (No model.) Issued September 29, 1882.

264,962. ROTARY PUMP. FRANCIS M. ROOTS, Connersville, Ind. Filed Mar. 6, 1882. (No model.) Issued September 26, 1882.

264,990. FIRE-PLACE ATTACHMENT. JAMES P. WINTER, Greenup, Ky. Filed June 5, 1882. (No model.) Issued September 26, 1882.

264,992. STOVE-GRATE. HENRY L. ANDERSON, New York, N. Y. Filed Feb. 10, 1882. (No model.) Issued September 26, 1882.

264,994. STOVE. MICHAEL C. ARMOUR, Chicago, Ill. Filed Oct. 7, 1881. (No model.) Issued September 26, 1882.

265,032. GRATE-BAR AND FURNACE. WILLIAM H. DEVALIN, San Rafael, Cal. Filed July 22, 1882. (No model.) Issued September 26, 1882.

265,089. GRATE FOR BOILER-FURNACES. MURILLO DOWNER and JOSEPH MOHR, Chicago, Ill. Filed Aug. 2, 1882. (No model.) Issued September 26, 1882.

265,066. MANUFACTURE OF REFRACTORY FURNACE-LININGS. JAS. HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed July 31, 1882. (No specimens.) Issued September 26, 1882.

265,067. ART OF LINING FURNACES, &c. JAS. HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed June 21, 1882. (No specimens.) Issued September 26, 1882.

265,068. COMPOUND FOR FURNACE-LININGS. JAS. HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed Aug. 10, 1882. (No specimens.) Issued September 26, 1882.

265,069 to 265,075. COMPOUND FOR FURNACE-LININGS AND FIRE-BRICK. JAS. HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed September 1, 1882. (No specimens.) Issued September 26, 1882.

265,076 MANUFACTURE OF REFRACTORY FURNACE-LININGS AND FIRE-BRICK. JAS. HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed Aug. 23, 1882. (No specimens.) Issued September 26, 1882.

265,077. MANUFACTURE OF REFRACTORY FURNACE LININGS AND FIRE-BRICK. JAS. HENDERSON, Bellefonte, Pa., assignor to Charles G. Francklyn, New York, N. Y. Filed Aug. 31, 1882. (No specimens.) Issued September 26, 1882.

265,080. PUMP. ALFRED A. HINDS, Lexington, Ind. Filed July 24, 1882. (No model.) Issued September 26, 1882.

265,131. UNDERGROUND CONDUIT FOR ELECTRIC WIRES. CHAS. O'BRYON, Philadelphia, Pa., assignor of one-half to John E. Brown, same place. Filed May 23, 1882 (No model.) Issued September 26, 1882.

265,158. FURNACE-GRATE. FREDERICK SHRIVER, Grand Rapids, Mich. Filed May 9, 1882. (No model.) Issued September 26, 1882.

265,163. FIRE-PLACE. JAMES G. SMITH, Cleveland, Ohio. Filed July 22, 1882. (No model.) Issued September 26, 1882.

265,177. FILTER. JOHN N. STEVENS, Toledo, Ohio. Filed Apr. 8, 1882. (No model.) Issued September 26, 1882.

265,217. WINDOW VENTILATOR. EDWARD G. CALDWELL, Newton Centre, Mass., assignor to Georgiana D. Caldwell, same place. Filed May 3, 1882. (No model.) Issued September 26, 1882.

265,222. REGISTERING GAS CONSUMPTION AND MANUFACTURING TO A STANDARD. HENRY H. EDGERTON, Danbury, Conn. Filed April 10, 1882. (No model.) Issued September 26, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to December 1, 1882.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending Dec. 30, of an urban population of 6,323,497, there died 2,616, which is equivalent to an annual death rate of 21.3 per 1,000, being very slightly less than the average death rate for the preceding five weeks.

Deaths from small pox are reported in Brooklyn, Philadelphia, Chicago, Louisville, Atlanta and Nashville. Ten deaths from this disease are reported in Philadelphia. Diphtheria and croup continue as in the preceding week.

Taking the deaths in United States cities for the five weeks ending December 30, we find that the mortality was at the annual rate of 21.4 per 1,000, being an increase on the prededing five weeks for which it was 20.4 per 1,000.

This increase is mainly due to acute lung diseases and measles, and has chiefly occurred in the North Atlantic and Eastern cities, especially in the latter in which it has risen from 21.5 per 1,000 for the five weeks ending Dec. 23, to 22.9 for the last five weeks, and for the last week to 23.4, the death rate in Albany and Newark being very high.

The average death rates for the last five weeks have been for North Atlantic cities, 21.8; Eastern cities, 22.9; Lake cities, 17.6; River cities, 19.7. Southern cities—Whites, 17.6; Colored 27.

The proportion of deaths from consumption to the whole number of deaths reported is 14.3 per cent.—a trifle less than it was during the preceding month, while the proportion of deaths from acute lung diseases has risen from 10.3 to 15.4 per cent. of all deaths.

On the other hand diarrhœa, typhoid and malarial fever show a marked diminution. All or nearly all of these changes can be explained by meteorological conditions.

The increase in measles is confined to the North.

The proportion of deaths among children under five years was 35.3 per cent., almost the same as during the preceding month. It is lowest among the Southern whites, where for the five weeks it was 25.2, and highest in the lake cities when it was 38.7 per cent.

Consumption caused 19.6 per cent. of all deaths among Southern blacks, while in the lake cities it only caused 10.1 per cent.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr T. M. Franklin reports three admissions, 18 discharges and three deaths during the week ending Dec. 30, leaving, 1,316 cases of insanity under treatment.

Digitized by Google

LOUISVILLE, KY.—Dr. E. R. Montgomery reports that there are no indications of small-pox becoming epidemic.

PITTSBURGH, PA.—Dr. Snively reports three cases of small-pox during the week.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 12 new cases of scarlet fever and three of diphtheria.

BOSTON, MASS.—C. E. Davis, Jr., reports 66 cases of diphtheria, 16 of scarlet fever and eight of typhoid fever.

HUDSON CO., N. J.—The report for Dec. 23 was received too late for insertion in our table in last week's issue. There were 100 deaths; 33 of the decedents were under five years. Accidents caused five deaths, consumption four, croup six, diphtheria five, scarlet fever three and whooping cough one death.

NEW YORK CITY.—The N. Y. *Times* of Jan. 1 gives a summary of the records of the Bureau of Vital Statistics for the year ending Dec. 31. There were recorded 37,951 deaths, 27,321 births, 11,085 marriages and 2,678 still births. During the preceding year the figures were: deaths 38,624, births 26,130, marriages 10,077, and still births 2,462. The largest number of deaths was in July, 4,482 and the smallest in November, 2,461. The marriages and births did not vary much with the months. The largest number of each was in December. The deaths of 13 persons who were alleged to be 100 years and over were recorded as follows: 100, six; 102, one; 103, one; 104, one; 105, two, and 107, two. There were reported during the year the following cases of contagious diseases:

Years—	1882.	1881.	1880.	1879.
Scarlet fever	6,793	7,338	3,048	5,446
Diphtheria	3,504	5,272	3,307	1,783
Typhoid fever	684	965	508	432
Typhus fever	207	568	2	8
Cerebro-spinal fever	234	556	197	119
Measles	4,633	3,116	3,891	2,333
Small-pox	708	1,342	67	65

BALTIMORE, MD.—During the week ending Dec. 30, 161 births were reported and 239 deaths. Of the latter 129 were males and 110 females. Under five years 93, over 60 years 35. The annual rate is given as 30.38—that for the white population being 28.30, and for the colored 42.46. Small-pox caused 71 deaths, croup eight, diphtheria 17, scarlet fever five and whooping-cough one death.

MICHIGAN.—The report of the Secretary of the State Board for the week ending Dec. 23 indicates the prevalence of the following diseases: neuralgia, rheumatism, bronchitis, tonsilitis, consumption, influenza, intermittent fever and pneumonia.

Small-pox was reported at Richmond, Osceola, on the 27th.

NEW ORLEANS, LA.—The report for the week ending Dec. 23 shows a total of 120 deaths. White, males 47, females 32; colored, males 20, females 21; under five years, white 16, colored nine, over 60 years, white 16, colored five. Small-pox caused 13 deaths, typhoid fever one, malarial fevers 11, consumption 23, croup one, acute bronchitis four, pneumonia eight, pleurisy two, diarrhœa and dysentery two, and accident four deaths. Rate 28.14 for whites 25.38, for colored 36.00.

PORT OF BALTIMORE.—Dr. Steuart, Immigrant Inspector, in reporting for the two weeks ending Dec. 31, makes a note of the increased care exercised by English surgeons in the vaccinations performed on shipboard.

ONTARIO, CANADA.—The *Weekly Health Bulletin*, Dec. 16, issued by the Provincial Board of Health, shows the prevailing diseases to have been bronchitis, neuralgia, influenza, anæmia and consumption. Measles are almost absent from the list of diseases, and neither scarlet fever nor diphtheria occupies a prominent place on the list.

KINGSTON, JAMAICA.—Consul Geo. E. Hoskinson transmits the official abstract of births and deaths for Nov. Births 82; males 35, females 47; illegitimate 52; rate per 1,000 26.4; deaths 83, males 34, females 49; rate 26.7. In Nov. '81, the birth rate was 23.7, and the death rate 27.0. Mr. Hoskinson says that malarial and climatic fevers are the prevailing diseases. The city is in a dirty condition and ripe for an epidemic of any kind if once started. Yellow fever has prevailed at Port Royal for a month past, and sixteen deaths have been reported. At last report there were five cases in the hospital. The British fleet has been ordered away. Cautionary bills of health have been issued for late departures.

HAVANA, CUBA.—Dr. Burgess reports 7 deaths in the city during the week ending December 22. Of the decedents, three were citizens. The other deaths occurred in the military hospital.

ENGLAND.—L. H. Mitchell, Vice Consul-General transmits the return for the week ending December 16. The annual rate of mortality in 28 great towns in England and Wales averaged 26.9 per 1,000. The lowest rate was registered in Bristol 18.9, and the highest in Halifax, 37.7. The rate in London was 26.8. The 23 deaths from diphtheria in the 28 towns, included 13 in London, 2 in Birmingham, and 2 in Hull. Small-pox caused 3 deaths in Newcastle-upon-Tyne, and one each in Birmingham, Oldham, and Sheffield.

In London 2,569 births and 1,996 deaths were recorded. Allowing for increase of population, the births were 66 below, and the deaths 182 above the average numbers in the corresponding weeks of the last ten years. Measles caused 97 of the deaths, scarlet fever 41, whooping cough 27, typhoid fever 25, and diarrhœa 20.

SCOTLAND.—During the week ending December 16, the death rate in the eight principal towns was 32.1 per 1,000. This rate is 10.5 above the rate for the corresponding week of last year and 4.1 above that for the previous week of the present year. The lowest mortality was recorded in Aberdeen 24.7, and the highest in Dundee, 36.1. In Glasgow the rate was 35.4. Measles caused 14 deaths in this city, scarlet fever 15, and whooping cough 27.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return of the Registrar General for the week ending Dec. 16, a summary of which is given in our weekly table.

BRUSSELS, BELGIUM.—During the week ending Dec. 9, there were 302 births and 179 deaths in the city and its suburbs, giving respectively the rates of 38.5 and 23.4 per 1,000 living. Of the decedents 67 were under five years of age. Small-pox caused one death, measles two, typhoid fever, diphtheria, and croup one each, diarrhœa 15, bronchitis and pneumonia 27, consumption 19. No deaths from scarlet fever or whooping cough.

STOCKHOLM, SWEDEN.—Consul Elfwing sends reports for the week ending Dec. 9. There were 110 deaths, males 57, females 53; under five years 41; over 60 years 15, annual rate 32.7. Measles caused three deaths, scarlet fever four, typhoid fever two, puerperal fever one, diphtheria seven, bronchitis seven, pneumonia 13, and consumption 18.

PARIS, FRANCE.—During the week ending Dec. 6, there were 1135 deaths, males 593, females 542; under five years 303, over 60 years 261. Typhoid fever caused 62 deaths, small-pox nine, measles 14, scarlet fever four, whooping cough six, diphtheria and croup 34, erysipelas five, consumption 196, acute bronchitis 48, pneumonia 85, and violence 31.

During the week ending Dec. 13, the deaths numbered 1,094, of which 614 were males and 480 females, 302 under five years and 235 over 60 years. Typhoid fever caused 49 deaths, small-pox seven, measles 16, scarlet fever three, diphtheria and croup 43, erysipelas three, consumption 212, acute bronchitis 45, pneumonia 75, and violence 37.

ST. PETERSBURG, RUSSIA.—Consul General Stanton reports for week ending Dec. 2, the occurrence of 568 deaths, under five years 264, over 60 years 62. Small-pox caused 37 of the deaths. Diphtheria and scarlet fever are also prevailing.

RIGA, RUSSIA.—Consular Agent Bomholdt reports as follows for the month of October: Births 528, males 270, females 258: deaths 336, males 169, females 167. In the previous month there were 478 births and 343 deaths. Causes of death: consumption 41, convulsions 31, pneumonia 26, diarrhœa 14, small-pox 12, diphtheria, ten, typhoid fever ten, croup nine, whooping cough nine, accident six, and puerperal fever three.

WARSAW, RUSSIAN POLAND.—Consul Rawicz reports for the week ending Dec. 9, the occurrence of 237 deaths; population 383,973. Five deaths from small-pox were registered.

VIENNA, AUSTRIA.—Consul General Weaver reports 340 deaths for the week ending Dec. 9, annual rate 23.9. Living births 529, annual rate 37.0. Among the deaths were one from small-pox, one from measles, five from scarlet fever, seven from diphtheria and one each from whooping cough and typhus and typhoid fevers. Consumption caused 77 deaths, acute lung diseases 44.

CALCUTTA, BRITISH INDIA.—Consul General H. Mattson sends reports for the weeks ending November 11 and 18. During the former there were 271 deaths, of which 42 were caused by cholera, 81 by fevers, 32 by diarrhœal diseases and nine by tetanus. The annual rate was 32.6 per 1,000. During the latter there were 274 deaths, of which 61 were caused by cholera, 72 by fevers, 35 by diarrhœal diseases, 18 by tetanus and one by diphtheria. The annual rate was 33.0. The death rate is characterized as moderate for the season, although cholera is above the average.

MADRAS, BRITISH INDIA.—The return for the week ending Nov. 17 shows 253 deaths; males 140, females 113. Rate 33.1. Small-pox caused four deaths, measles two, fevers 55, dysentery 32, diarrhœa 15, No deaths from cholera are reported. That for the week ending Nov. 24 shows 262 deaths; males 138, females 124; rate 34.2. Small-pox caused three deaths, fevers 77, dysentery 23, diarrhœa 11. No deaths from cholera or measles.

COLOMBO, CEYLON.—During the three weeks ending Nov. 8 the total number of deaths was seven, all of which were caused by small-pox. Fifty-seven cases were recorded during this period.

PENANG, CHINA.—Dr. F. K. Hampshire, the senior medical officer of the city, reports 273 deaths during the month of October. Fevers caused 90 deaths, small-pox eight, cholera 14, diarrhœa and dysentery 45 and old age 18. The report does not show the ages of the decedents. Cholera has increased during the month.

SINGAPORE, CHINA.—The monthly statement of the health of the town and suburbs for October shows a total of 388 deaths, of which number eight only were Europeans. Fevers caused 98 deaths, diarrhœa 29, consumption 33, cholera three and small-pox three.

SHANGHAI, CHINA.—Consul General Cheshire, under date of Nov. 14, reports catarrhal affections of the respiratory mucous membrane as common, but not severe. A case of diphtheria has been reported. This is an exceedingly rare disease in Shanghai; the total number of cases observed in the last 15 years not exceeding 20. During the following week a second case was diagnosed wholly unconnected with the first.

SAURABAYA, JAVA.—The cholora reports for the ten days ending Oct. 31 show a decrease in prevalence of the disease. There were 45 new cases reported as against 88 during the preceding 3d of the month. Small-pox has been declared epidemic, but no statistics have been transmitted.

BATAVIA, JAVA.—Consul Hatfield reports, under date of Nov. 25, that although official statistics have not yet been furnished, there is no doubt as to the decline of the cholera epidemic.

NEW ZEALAND.—Thos. T. Gamble, U. S. Vice-Consul at Auckland, transmits the Registrar General's report for Oct., 1882. The births in the various boroughs were 487 against 461 in the previous month. The deaths were 181, an increase of 16 in the month of September; males 101, females 80; under five years, 81, equal to 44.75 per cent. of the whole number. Measles, scarlet fever, diphtheria, croup, and whooping cough are found on the return, the first having caused seven deaths and the last two deaths.

SIDNEY, NEW SOUTH WALES.—Consul Chas. Kahlo sends the Registrar General's report for Oct. Births in Sidney, 290; deaths, 216; males 109, females 107; under five years, 82, over 70 years, 17. In the suburbs the births numbered 539, the deaths 209; males 100, females 109; under five years, 127, over 70 years, eight. Diarrhœa was the prevailing disease. A few fatal cases of croup, diphtheria, and whooping cough was recorded.

ST. PAUL DE LOANDA, AFRICA.—Consul L. de Rdu Verge reports 91 deaths during October, in a population of 12,000; of these 80 were caused by small-pox. The town is in bad sanitary condition. The stench from dead dogs and fish which lie on the streets and cover the beach in front of the town, penetrates everywhere.

MONTHLY REPORTS FOR NOVEMBER.

These reports were omitted from our last issue for want of space.

KNOXVILLE, TENN.—S. B. Boyd, M.D., Secretary Board of Health. Deaths, 19; white males five, females five; colored males six, females three; annual rate 13.29, for white 9.49, for colored 23.05; under five years seven; over 60 years one; consumption three, pneumonia one, and small-pox one.

MACON, GA.—J. Emmett Blackshear, M.D., Chairman Board of Health. Deaths, 25; white males, eight; females, eight; colored males, four; females; 5. Annual rate 17.65, for whites, 21.33, for colored 13.50; under five years, white, seven; colored, six; over 60, white, one, colored, one. Croup one, scarlet fever one, consumption one and malarial fever one.

OAKLAND, CAL.—J. R. Bradway, M.D., Health Officer. Deaths 49; males, 33, females 16; under five years, nine; over 60 years, 11. Annual rate 16.30. Violence, three; consumption, 6; diphtheria, four; pneumonia, three; congestion of lungs, one; bronchitis, two. No deaths from scarlet fever, measles, small-pox or whooping cough. Births, 53; males, 33, females, 20.

PROSECUTIONS UNDER THE FOOD AND DRUG LAW.

The first case of the State Board of Health against a grocer of this city for selling adulterated cream of tartar came up for trial before Justices Kilbreth, Smith and Ford at the court of Special Sessions last Monday, Henry Fulle, a grocer of 823 Second avenue, being the defendant. Dr. E. G. Love, State Analyst, testified that the sample which he bought at the defendant's store consisted of 92 per cent. ground gypsum and 8 per cent. tartaric acid. The defendant testified that he bought the article for pure cream of tartar, paying therefor 45 cents a pound. The greater part of the first day was occupied with technical objections, the defendant's counsel at first strenuously objecting to the admission of the Pharmacopœia in testimony, and finally arguing at great length to show the unconstitutionality of the law, and also that it was not in force at the time of the offense, owing to the failure of the Board of Health to comply with a certain proviso contained in the act. At the conclusion of the case on Tuesday morning, the defendant was found guilty, and a nominal fine of $10 imposed, from which decision he appealed. The remaining cases were adjourned on account of the length of time occupied by this, and the number of prisoners awaiting trial.

DIPHTHERIA.

The London *Times* of Dec. 6, in an editorial relative to the illness of Mr. Fawcett, the Postmaster General of England, which illness is said to have been a combination of diphtheria and typhoid fever, remarks with regard to diphtheria, that we have very little knowledge either as to its causes, or the channels of its diffusion.

"We know, if not exhaustively, at least approximately, the methods by which enteric fever, or scarlet fever, or small pox is communicated; and also that these methods are different in the three cases; but about diphtheria we know nothing. Sometimes it appears to be actively contagious, and speedily assumes epidemic proportions in the locality where it occurs; at other times isolated cases are met within houses where many persons are brought into close contact with the sufferer. It is maintained with some probability that people living under unfavorable sanitary conditions are more prone than others to contract diphtheria if they are exposed to it; but something not very unlike this is true of all other diseases. The insanitary conditions have certainly no direct influence either upon its origin or its propagation. A few years ago, an epidemic of diphtheria occurred in one of the London suburbs; and the discovery of a choked main sewer was eagerly hailed as affording an explanation of the facts. Further examination, however, showed that the epidemic had not originated in the region of the sewer in question, and was not only not confined to it, but was neither more prevalent nor more severe there than in adjacent regions, the sewerage of which was sound. There is no evidence that drinking water acts as a channel of conveyance; so that, in a few instances in which the families of the sufferers have obtained their milk supplies from a common source, the attention of investigators has been directed rather to the state of the cows by which the milk was furnished than to the water which, in dairy phraseology, was used to 'rinse the pails;' and a suspicion has been entertained that a diseased secretion from the udder might be the original poison. Since this was the first suggested, there have been two or three diphtheritic outbreaks roughly coinciding with a community of milk supply; but the evidence at present obtained has not been sufficient to connect the two things together with any approach to certainty. Indeed, the hypothesis first formulated on the subject can hardly be said to have been strengthened in any material degree. It is a curious fact that many of the more fatal outbreaks of diphtheria have occurred in remote villages, in some of which a large proportion of the inhabitants have been struck down; and in these a common milk supply would be an ordinary result of the condition of life in the place, and might easily be a mere coincidence.

Digitized by Google

It seems to us that this is hardly a fair exposition of the existing state of knowledge about diphtheria, concerning which we probably know as much as we do about enteric fever, or scarlatina. The researches of Drs. Wood and Formad have shown that the cause of diphtheria is a minute organism or micrococcus, which can be cultivated outside of the body, but which under the culture conditions employed by them, rapidly loses its virulence, and that this micrococcus can take on specially contagious and virulent properties, very much as the harmless hay *bacillus* can develop into the deadly *bacillus anthracis* under special conditions of temperature and nutriment. At first it is a strictly local disease, and in the mild and sporadic cases it remains such—the micrococcus does not pervade the system, although some of the products which it secretes, probably an alkaloid, enters the blood and produces fever, etc. In such cases the blood and secretions of the body are not contagious. In the epidemic and virulent form the micrococcus is probably in the blood, for in such cases a wound in any part of the body will become diphtheritic, and a new focus of infection. It is true that we do not know the conditions under which this germ becomes virulent, neither do we know why scarlatina is sometimes mild and at other times malignant. The *Times* is quite right in calling attention to the fact that diphtheria is a village disease, rather than one of large and sewered cities.

PREVENTING THE INTRODUCTION OF CONTAGIOUS DISEASES.

The following bill was introduced into the United States Senate, December 19.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That the tenth section of the act approved June second, eighteen hundred and seventy-nine, entitled "An act to prevent the introduction of contagious or infectious diseases into the United States," and so much of the act making appropriations for the sundry civil expenses of the government for the fiscal year ending June thirtieth, eighteen hundred and eighty-three, approved August seventh, eighteen hundred and eighty-two, as restricts or limits the operations and duties of the National Board of Health, be, and the same are hereby, repealed.

SEC. 2. That of the unexpended balance remaining to the credit of appropriations made for the National Board of Health prior to June thirtieth, eighteen hundred and eighty-two, the sum of one hundred and twenty-four thousand dollars, or so much thereof as may be necessary, is hereby continued and made available for carrying out the provisions of the several acts creating the board and defining its powers during the remainder of the current fiscal year, and for the fiscal year ending June thirtieth, eighteen hundred and eighty-four.

SEC. 3. That of the appropriations heretofore made and still standing to the credit of the National Board of Health to enable it to aid state and local boards of health and local quarantine stations, to be used only in case of epidemic, the sum of one hundred thousand dollars is continued and made available for the same purpose during the fiscal year ending June thirtieth, eighteen hundred and eighty-four.

The statistical report of the year's work of the Auxiliary Sanitary Commission of New Orleans shows that of 17,035 premises inspected, containing 73,574 persons, 14,170 had cisterns, 4,302 hydrants, 1,586 wells and 420 no water. Of the privy vaults 9,464 were in good condition, 7,571 were full or foul, and 1,486 were defective. Sixteen hundred lots had defective drainage. Three hundred and fifty-eight dairies were inspected, of which 117 were in bad condition.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

The publisher of THE SANITARY ENGINEER will esteem it a favor if names of persons likely to be interested in the journal are sent to him, in order that he may send them specimen copies.

Pure Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels.*

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.

DECASTRO & DONNER REFINING CO.

117 WALL STREET,

NEW YORK.

Good Coffee

No. 41.

Roasted and packed in Pound Packages as a guarantee of genuineness (in the Bean, not ground). Ask your Grocer for Thurber's No. 41 Price 30 cents per Pound. Good Coffee is often spoiled in the making, therefore an approved Recipe is placed in every Package.

If you cannot get No. 41 Coffee at your Grocers, and desire to try it, send us a Postal Card and we will see that it is supplied.

FOR SALE BY

THE SANITARY ENGINEER,

P. O. Box 3037. 140 William St., New York

Copies will be sent, postage paid, on receipt of price.

A Valuable Book of Reference.

THE FIFTH VOLUME OF

THE SANITARY ENGINEER,

OF NEW YORK,

Includes the twenty-six weekly issues from December 1st, 1881, to May 25th, 1882.

A complete record of all United States Patents for structures and appliances used in plumbing, sewerage, gas fitting, gas manufacture, steam and hot water heating, ventilation, and electric lighting, makes it valuable to inventors and manufacturers.

The following are a few of the many articles of permanent interest:

A review of town sewering in England, with opinions on the question of small *versus* large sewers, or the combined *versus* the separate systems, by Robert Rawlinson, C.B, Chief Engineer, Inspector Local Government Board, England.

A report on the Sewerage of Concord, by Edw. S. Philbrick, C.E., instructive to town authorities generally.

Remarks by John S. Billings, Surgeon, U. S. Army, before the Academy of Medicine, New York, on sewer gas and the value of modern methods for excluding it from houses. This article throws considerable light on a question generally misunderstood.

Electric Lighting; its Fire Risks and their Remedies. Two articles by Prof. Henry Morton, President Stevens Institute of Technology, Hoboken, New Jersey,

Illustrations, with description of the Arrangements for Heating and Ventilating the Bridgeport School House (intended to be a model building).

A continuation of Dr. J. S. Billings' Letters to a Young Architect on Ventilation and Heating, with illustrations of notable buildings.

A continuation of the "Sanitas" articles on Plumbing Practice (illustrated). Interesting to architects, builders, and plumbers.

Steam Fitting and Steam Heating, by "Thermus," a series of practical articles (illustrated), of great value to steam fitters and architects.

Illustrated Descriptions of notable jobs of Plumbing Heating, and Ventilating in Private Residences in the United States, including those of Mr. W. H. Vanderbilt and Mr. R. H. Bishop, of New York.

A series of articles on Petroleum Legislation in the United States, by E. G. Love, Ph. D.

A Report to the Greenock Board of Police on the Ventilation of the Sewers of Thirty-three Towns in England, compiled from information received from City Engineers, by Alex. J. Turnbull, C.E. Valuable to engineers and health officers.

A series of carefully prepared editorials on the Water Supply of New York, discussing the various schemes proposed for increasing it; also the measures to prevent waste. Opinions of prominent English engineers on the practice in England, and suggestions for American adoption, in connection with a controversy over the rules of the New York authorities with regard to the manner of flushing water closets. The letters and articles on the question of Valve *versus* Direct Supply to Water Closets are of great interest to manufacturers, plumbers, health officials and water works engineers.

Reports on Adulteration of Food and Drugs in the State of New York, being full abstracts of the reports of Professor Chas. F. Chandler, on Milk (fresh and condensed); Prof. G. C. Cornwell, on Butter (dairy and artificial), Cheese, Lard, Olive Oil, and Fruit Essences; by Professor A. H. Chester, on Canned Meats and Animal Foods; by Dr. E. G. Love, Ph.D., Cereals and the Products and Accessories of Flour, Special Artificial Foods for Infants and Idvalids, Baking Powders, Cream Tartars, Alum Powders and the "Alum Question;" by Professor A. S. Lattimore, on Canned Fruits and Vegetables, Vinegar Spices, etc.; W. H. Pitt, M.D., on Sugars, Glucose, etc.; J. E. Englehardt, Ph.D., on Wines, Beers, Spirits and Cordials; by J. Hoffman, Ph.D., on Crude Vegetable and Animal Drugs, Pharmaceutical Chemicals and their preparations; by Professor Caldwell, on Quinine Pills and Capsules; by W. G. Tucker, M.D., on Citrate of Magnesia and Seidlitz Powders.

These reports are on examinations made under the direction of the New York State Board of Health with a view of ascertaining the condition of the Food and Drug supply in the State, and the extent and charaeter of the adulterations practiced. They are valuable to health officials, analysts, and manufacturers.

Notes upon some Prosecutions in Great Britain under the Food and Drugs Act, by Alfred Senier, M.D., F.C.S.

Paris Street Cleaning, by James Tallmadge Van Rensselaer. An elaborate and full account of the system and the cost of its maintenance—of value to city authorities.

Washington Drainage, a carefully prepared review of the evils complained of, and the various schemes proposed for the reclamation of the Potomac Flats and the sewerage of the city.

Price, bound in cloth, $4.00. Postage 40 cents.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S.A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

THE BELL WATERPHONE COMPANY.

Sole Proprietors of the Invention for the Prevention of the Waste of Water, and the Discovery of Leaks in Water Craft and the Detection of Defects in Mechanical Movements.

It is specially adapted to the use of Plumbers and for Water Works.

Address,

FACILITIES FOR GRINDING.

TRENTON, N. J.

BRADSTREET'S:

A Journal of Trade, Finance and Public Economy.

Published by The Bradstreet Company,

279, 281, 283 Broadway, New York.

Terms, $5.00 *per year in advance, including postage.*

SINGLE COPIES, TEN CENTS.

Specimen Copies will be sent free upon Application.

As a financial and commercial newspaper the foremost purpose of BRADSTREET'S is to be of practical service to business men.

Its special trade and industrial reports; its weekly epitome of bankruptcies throughout the United States and Canada, and the summaries of assets and liabilities, are alone worth the subscription price.

The synopses of recent legal decisions constitute an exceedingly valuable feature.

As commercial transactions, in the wider sense, are coming to be more and more conducted on a statistical basis, the information contained in BRADSTREET'S is of the first importance both to producers and middle-men.

THE TRADE AND AGRICULTURAL SITUATION THROUGHOUT THE UNITED STATES AND CANADA IS REPORTED BY TELEGRAPH TO BRADSTREET'S UP TO THE HOUR OF PUBLICATION.

MR. C. N. DOUGLASS'

SCHOOL FOR BOYS.

Thorough preparation for the best Colleges and Scientific Schools and for business. Pupils received at any time. The classes are small, and much of the teaching individual. References furnished on application.

Book Department.

The Business Manager of THE SANITARY ENGINEER begs to announce that he has established a Book Department for the sale of Books treating on subjects in which the readers of that journal have a special interest. Orders for Books are therefore solicited. Arrangements are being perfected to supply foreign scientific books promptly.

A line of Books on the following subjects kept in stock: Sanitary Engineering, Architecture, Construction, Engineering, Gas Manufacture, Electric Lighting, Sewage Disposal, Drainage, Plumbing, Food Adulteration and Hygiene. Lists sent on application.

BALDWIN, WM. J., STEAM HEATING FOR BUILDINGS. Or, Hints to Steam Fitters. Being a description of Steam Heating Apparatus for Warming and Ventilating Private Houses and Large Buildings, with Remarks on Steam, Water and Air in Relations to their Heating. To which are added useful miscellaneous tables. Third edition. With many illustrative plates. 12mo, cloth, $2 50

DREDGE, JAS. ELECTRIC ILLUMINATION. General Principles, Current, Generators, Conductors, Carbons, and Lamps. By Conrad W. Cooke, M. F. O'Reilly, James Dredge, S. P. Thompson and H. Vivarez. Chiefly compiled from Engineering, edited by Jas. Dredge; with abstracts of the specifications deposited at the Patent Office between 1837 and 1872 having reference to Electric Lighting, prepared by Mr. W. Lloyd Wise. About 600 pages text, nearly 800 illustrations...4to, cloth, $7 50

LOCK, WIGNER & HARLAND. SUGAR GROWING AND REFINING. A Comprehensive Treatise on the Culture of Sugar-Yielding Plants, and the Manufacture, Refining, and Analysis of Cane, Beet, Maple, Melon, Milk, Palm, Sorghum, and Starch Sugars; with copious Statistics of their Production and Commerce and a chapter on the Distillation of Rum. By Charles G. Warnford Lock, F.L.S., Editor of Spons' Encyclopædia of Manufacturers and Raw Commercial Products, and G. W. Wigner & R. H. Harland, FF.C.S., FF.I.C., Public Analysts, etc. Illustrated by 10 plates and 205 Engravings.....Demy 8vo, cloth, $12 00

BENJAMIN, PARK. WRINKLES AND RECIPES. Compiled from the *Scientific American*. A collection of practical suggestions, processes and directions, for the Mechanic, Engineer, Farmer and Housekeeper. With a Color Tempering Scale, and numerous wood engravings. Revised by Prof. Thurston and Vander Weyde, and Engineers Buel and Rose. 12mo, cloth, $2 00

DU BOIS, A. J. THEORY OF STEAM ENGINE. Translated from the fourth edition of Weisbach's Mechanics, containing notes giving practical examples of Stationary, Marine, and Locomotive Engines, showing American practice. By R. H. Buel. Numerous illustrations..... 8vo, cloth, $5 00

DU BOIS, A. J. THERMO-DYNAMICS, THE PRINCIPLES OF. With Special Applications to Hot-Air Gas and Steam Engines. By Robert Röntgen; with additions from Profs. Verdet, Zeuner, and Pernolet. Translated, revised, and enlarged by Prof. A. Jay Du Bois, of Sheffield Scientific School. 670 pages, 8vo, cloth, $5 00

HATFIELD, R. G. THE AMERICAN HOUSE CARPENTER. A Treatise on the Art of Building, comprising Styles of Architecture, Strength of Materials, and the Theory and Practice of the Construction of Floors, Framed Girders, Roof Trusses, Rolled Iron Beams, Tubular Iron Girders, Cast Iron Girders, Stairs, Doors, Windows, Mouldings, and Cornices, together with a Compend of Mathematics. A Manual for the Practical use of Architects, Carpenters, and Stair Builders. Re-written and enlarged. Numerous fine wood engravings. (1882)..... ....8vo, cloth, $5 00

HATFIELD, R. G. THE THEORY OF TRANSVERSE STRAINS, and its Application to the Construction of Buildings, including a full discussion of the Theory and Construction of Floor Beams, Girders, Headers, Carriage Beams, Bridging, Rolled Iron Beams, Tubular Iron Girders, Cast Iron Girders, Framed Girders and Roof Trusses, with Tables calculated expressly for the work, etc., etc. By R. G. Hatfield Architect. Fully illustrated. Second edition with additions. (1880) 8vo, cloth, $5 00

They can be supplied in London, by our Agents, Messrs. E. & F. N. Spon, 16 Charing Cross.

The following back numbers of THE SANITARY ENGINEER are worth preserving, and will be sold at prices quoted until further notice:

February, 1878..... 50 cents.

Contains an article on "Plumbers' Profits." Useful when a plumber's bill is disputed, as showing what percentage of profit is necessary and legitimate.

April, May, June, July ... . } for the set $1.00
and October, 1878..... } or 20 cents each.

These issues contain articles from E. S. Philbrick, C.E., on "The Ventilation of the Public Sewers;" Robert Briggs, C.E., on "Heating and Ventilation," and Col. Geo. E. Waring, Jr., on the "Sanitary Aspects of Plumbing."

December, 1878, and January, 1879.....each 30 cents.

Article on the Electric Light, by Prof. Henry Morton, President of Stevens' Institute of Technology, "Terms of the Competition for Improved Tenement Houses." Articles on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., "Ventilation of the Capital at Washington," by Robt. Briggs, C.E. "Sanitary Condition of Tenement Houses," and Irvington Sanitary Survey," by Col. G. E. Waring, Jr.

March, 1879..... .....$1.00

Contains "Prize Plans in Tenement House Competition," with report of Committee of Award; a history of the movement which led to the passage of the Tenement House Act in New York.

March, April, May, June 1 and 15, and July 1, 1879, only a few left.....for the set $4.00

This series contains the ten selected plans on the "Model Tenement House Competition."

May, 1879.... .....50 cents

Has article on the "Holly System of Steam Heating," by Robt. Briggs, C.E. Article on the "Water Supply of Small Towns," by E. S. Philbrick, C.E., and seventh and eighth "Prize Plan in Tenement House Competition."

August 1, 1879 ....30 cents

"Plan and Description of a Model Paris Apartment House," by Lewis W. Leeds. Article No. 3 on "Domestic Sanitation," by E. S. Philbrick, C.E.

September 1 and 15, October 15, November 1 and 15, 1879..... .....each 30 cents

In this series is an illustrated description of the "Heating and Ventilation of the Utica Insane Asylum;" article on "Food Adulteration Abroad," by Prof. Henry Morton; "Domestic Sanitation," by E. S. Philbrick, C.E. Articles on "Water Gas—Its History and Manufacture," by Prof. Henry Morton, Ph.D. "Sanitary School Construction," by Dr. D. F. Lincoln; an opinion on the "Validity of the McCloskey Patent," by J. N. McIntire, Patent expert.

March 1 and 15, April 15, 1880.....each 50 cents

Valuable, as they contain results of "Model School House Competition," with report of the Committee of Award, and eight of the Prize Plans.

May 1 and 15, 1880 ....each 50 cents

Very valuable for reference, as they contain full report (illustrated) of Dr. Carmichael, of Glasgow, on his experiments to test the liability of sewer gas and disease germs to pass through a water seal trap. Often referred to.

October 15 and November 1, 1880... .....each 50 cents

An account of the "Heating and Ventilating Arrangements of the Madison Square Theatre;" "How to Utilize Exhaust Steam to Heat a Factory" (Illustrated). "English Adulteration Acts," by G. W. Wigner, F.C.S. An illustrated description of the Sewerage of Memphis.

December 1, 1880.....50 cents

Contains report of the Committee of Award in the "Food Adulteration Competition;" an article on "Recent History of Electric Lighting," by Prof. Henry Morton. A review of schemes for the sewerage of Newport, R. I. "Arsenical Wall Paper," by Dr. E. S. Wood, of Harvard Medical College.

May 15, 1881.....50 cents

A Review of Prof. Pumpelly's report on the filtering capacity of soil; an article on the "Safety of Theatres," by Jas. Harrison, Superintendent of the Board of Fire Underwriters, N. Y. A plan for removing ground water from a city house to the sewer (illustrated). A sectional plan of fitting up a Double Hot Water Boiler, as done in New York.

August 1 and 15, and September 1, 1881.....each 25 cents

Contains letters and articles giving full account of the system of Disposing of Refuse and Sewage at Birmingham, England.

October 1 and 15, and November 1 and 15, 1881....., ...each 25 cents

Review of Col. Waring's article in *Scribner's* on the "Drainage of New York." Article No. 1 on the system of "Water Waste-Prevention in Liverpool." Plan and description of a Sewer Weir and Geometrical Stair Case, designed by Sir Jos. Bazalgette, London; the Municipal Chemical Laboratory of Paris, by Dr. De Pietra Santa.

Address, BOOK DEPARTMENT, THE SANITARY ENGINEER,

P. O. Box 3037, 140 William Street, New York.

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration. Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

BARSTOW STOVE COMPANY,
230 Water Street, New York.

THE JOEL HAYDEN BRASS CO.,

MANUFACTURERS OF

BRASS GOODS FOR STEAM, WATER AND GAS.

JOHN P. GILLIS, *General Agent.* 82 JOHN STREET, NEW YORK.

STEWART'S PAT. VENTILATING TRAPS

IN STONEWARE AND IRON.

Simple in construction. No Valves to get out of order. Automatic in action. Cheapest and best ever introduced. One placed as an INTERCEPTOR between house and street sewer, or Cesspool, will positively exclude foul air from any house. *WE GUARANTEE THIS.*

Price Lists and Testimonials mailed by STEWART & CO., MANHATTAN POTTERY, foot of West 18th & 19th Streets, and 312 Pearl Street, cor. Peck Slip, New York.

RECENTLY PUT INTO THE **WHITE HOUSE** BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 Superior Street,

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL S TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O.

Every Subscriber should have one of our neat BINDERS to preserve the copies of THE SANITARY ENGINEER for future reference. Price, $1.00. Postage paid.

Salt- Glazed, Thoroughly Vitrified

Sewer and Drain Pipe,

MANUFACTURED BY

OTIS & GORSLINE,

At ROCHESTER, N. Y.

New York Office and Yard, { EAST 138TH STREET, MOTT HAVEN.

These pipes are made from a combination of superior clays, are thoroughly VITRIFIED, and SALT GLAZED. Indestructible from the action of all the elements, can be laid perfectly tight, and more durable than iron.

☞ Send for Illustrated Catalogue.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

CREQUE'S PATENT

New Circulation

RANGE BOILERS

13 different styles—adapted and warranted for every possible situation.

ESSENTIAL FEATURES.

1st. Cold water is introduced at the bottom of the boiler, while hot water is injected into the top of the boiler.

2d. By this system the chilling of the hot water in its passage to the top of the boiler is avoided.

3d. Hot water being stored at the top of the boiler without chilling, it can be used immediately; thus making the boiler serviceable as soon as the water-back is heated.

4th. The circulation is positive in direction and rapid in action, and heats in very much less time.

5th. Circulation being positive, there is no cracking, snapping or rumbling in the boiler.

6th. There being no reversal of circulation, there is no sudden expansion and contraction of the boiler shell. The boiler will therefore wear longer.

7th. In case of a part of the boiler being filled with steam, a sudden injection of cold water does not condense it, as the injection is at the *bottom* of the boiler, thus forcing the heated water above it to fill the space left by escaping steam, when a hot water cock is opened.

8th. A considerable saving in material and labor in cost of setting up the boiler and connecting pipes.

9th. In consequence of a rapid, invariable and constant circulation, much more hot water can be obtained from a small sized boiler than from a much larger boiler of the old method of circulation. These boilers are arranged to meet every conceivable requirement of location or condition. To both the plumber and architect this is a great advantage, while it also lessens the cost to the builder.

N. B.—Please send for Catalogue fully explaining the various situations for which these boilers are intended.

A MODEL SLOP SINK,

IN ONE PIECE OF EARTHENWARE.

When set on and surrounded by White Glazed Tile, as shown, it makes the cleanest and most useful Slop Sink arrangement we know of.

It is provided with a Flushing Rim similar to the Hellyer Hoppers.

It is sold with the Flushing and Water Supply apparatus, that is made of Brass Pipe, as illustrated, or with a set of Combination Cocks to attach to Lead or Iron Pipes that may be concealed behind the wall.

It is arranged so that no overflow can take place when a pail may be set over the outlet hole and the water carelessly left running.

Persons wanting some such thing will find it worth while to take the trouble to call at our warerooms and examine it.

The apparatus complete, as shown, we designate as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 40.

When the Combination Cocks and the Hoppers only are wanted, it is designated as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 41.

We have fitted up Show-rooms at No. 1 Pemberton Square, Boston, where our specialties can be seen. Persons living in Boston and vicinity are invited to call and examine them.

We have fitted up in our warerooms the various styles of Water Closet Apparatus that are to be taxed in this city $2.00, $5.00, $10.00 and $20.00 per year respectively. Architects, Plumbers, and Householders who may be interested, can there see which arrangement is best suited for their particular needs.

ADVERTISEMENTS 159-168

THE TRAP VENTILATION PATENT SUIT.

In our issue of February 15, 1881, we announced that a suit had been brought by Mr. John McCloskey against Mr. James H. Young, of this city, for infringement of a patent for ventilating traps. In the issue of November 15, 1880, we noticed this patent at length, and printed an opinion by Mr. J. N. McIntire against its validity.

In the issue of February 15 we stated "we have no doubt that some of our readers can indicate places where traps have been ventilated prior to 1877 in substantially the same manner as claimed by the McCloskey patent, and we shall be glad to print letters giving information on this point." In response to this invitation we received letters and one from Mr. James Tucker, of Boston, we printed. It was subsequently suggested that the printing of letters offering evidence against this patent, then in litigation, would tend to make McCloskey unpopular. As this result we desired to avoid we ceased their publication. But having been instrumental in inducing the public to use this arrangement and having represented that it was not patented (which at the time was the fact), and knowing that it had been in use in Great Britain for more than twenty-five years, and realizing the further fact that wherever plumbing regulations had been adopted this feature was required as an essential in every properly arranged piece of plumbing, we felt that our duty to the community demanded that we should use all proper means to see that the claims of the various parties in interest were thoroughly investigated. With that object in view we retained Messrs. Betts, Atterbury & Betts, counsel widely known as experienced in patent litigations, to examine into the case and consider the new testimony that we were able to submit. Mr. Edward Heaton, Mr. Young's solicitor, thereupon availed himself of the services of these gentlemen as counsel. It was then deemed necessary to have the case re-opened in order that the testimony elsewhere printed might be introduced, and for the reasons there given. Affidavits were therefore presented to the Court indicating the character of the new evidence, and representing that if because of the absence of this evidence, which proved the two years' prior use, a decree should be issued sustaining a patent of this character, it would work a hardship on multitudes of individual houseowners, who would feel forced to pay royalties or damages, rather than assume the great expense of securing the reversal of a decree of the United States Circuit Court. The Court decided to allow the introduction of the testimony referred to; and it was given at length, and with illustrating diagrams, during the succeeding year. The plaintiffs finally withdrew their suit, and paid costs of Court.

An examination of the testimony will, we think, satisfy any one that it is ample to show the prior use in the United States of the feature claimed in the McCloskey patent, and quite sufficient to demonstrate its invalidity. Should at any future time this patent pass into the hands of other parties, and attempts be made to collect royalties from householders, it should be the duty of the local Boards of Health to protect the people under their jurisdiction, and the matter we have printed may be of service in such an emergency.

A bill providing for the registration of plumbers and supervision of plumbing work in Cincinnati has been introduced in the Ohio Legislature, at the instance of the Master Plumber Association of that city. According to the *Commercial Gazette*, Senator Dixon desired that action on it be deferred until it was seen whether the Courts would sustain the law in New York. For the information of the Senator, we would say that on two occasions, thus far, the Courts have sustained the law in this State. The first instance was referred to in our issue of August 3 last, and the Crotty case was mentioned in the issue of January 4, current volume. Moreover, the law is warmly sustained by reputable plumbers, the medical profession, the entire press, and indeed every one but the skin builders and plumbers. We feel sure that if there is a real desire to pass such a law in Ohio, there are lawyers there who can frame a bill that, if enacted, will be sustained by the State Courts.

We were mistaken in our statement last week that the ordinance for the regulation of plumbing in Boston had been finally adopted. After a discussion over the measure in the Board of Aldermen, it was referred to the Committee on Ordinances, with instructions to give the heads of the Water and Health Departments a hearing and report within two weeks. The Society of Architects desire certain changes in the ordinance. They have invited Messrs. William Trainer, Isaac Riley and James Tucker, as representing the views of the plumbers, to confer with them on the changes, and will urge them on the Ordinance Committee.

It would be unfortunate if differences of opinion over the details of the rules should result in a defeat of the entire bill. Indeed, it would be impossible to devise any set of rules that some one could not criticise.

Now it is Philadelphia's turn to join this movement so eminently characteristic of the present tendencies of sanitation in this country,

Digitized by Google

and she sends a delegation to this city to inquire into the working of the plumbing law. On the 11th inst. a committee of the Select and Common Councils and the Chief Engineer of the Survey Department visited the Health Departments of New York and Brooklyn and by Col. Clark, Dr. Raymond and others were given the information and documents which will, we hope, result in the passage of an ordinance similar to our law. Should this prove the case, then Boston, Chicago, Washington, Montreal, Cincinnati and Philadelphia, Jacksonville, Fla., and Lawrence, Mass., may all be claimed as converts to the system to which this community was gradually brought after four years of agitation, for each of these cities now either has a law regulating plumbing in force or has progressed so far in discussion that legislation of some sort is sure to follow. Yet it is only eighteen months since the New York bill became a law and ten since it was enforced, with much trembling and fear at first. For a year and half's progress, this is fair.

General James L. Selfridge has been appointed Health Officer of Philadelphia in place of John E. Addicks deceased. We have read attentively the biographical sketch of Gen. Selfridge, published in the Philadelphia *Bulletin* of the 10th inst., and learn from it that he was born in 1824. studied law for a year, and then became successively a commission agent, a clerk, a captain, colonel and brigadier of State troops during the war, an assessor of internal revenue, a candidate for the State Senate, and chief clerk of the State House of Representatives; and also that he is a prominent member of the Masonic Fraternity. We do not learn, however, that he has any of the special knowledge and training which a health officer should possess, and which would be very useful to Philadelphia at the present time. Is it not about time that the health officer of a large city should be selected for his reputation as a sanitarian rather than that of a politician?

Anybody could have told you that there would be a big stir, big demonstration, big inspection, after the Newhall House fire. This sort of thing has been for several years common enough to furnish good basis for prophecy, but he would be a wise man indeed who can tell what permanent results will come of it. On at least three occasions in the past two years there has been a similar stir for a season. First the theatres, then office buildings have been the objects of what must be termed untimely suspended animation. The course of things is about this: big catastrophe, big popular excitement, intense bustle in the department; no disaster, popular indifference, official repose; sum total of results, quite microscopic. Nevertheless we do not imagine that Mr. Esterbrook is to blame. Probably he and the Building Department do all that they can do. The obstacles thrown in the way of efficient action on the part of the Building Department by its organization and the involved manner in which only its decrees can be enforced are, we fear, insurmountable. The Department is about in the condition of the jumping frog—ready enough to leap when prodded, but too heavily loaded to get very far.

AMERICAN ARCHITECTURE AND PLUMBING SEEN THROUGH ENGLISH EYES.

American architecture and plumbing were highly praised at a recent meeting of the Royal Institute of British Architects. The author of the paper, Mr. A. J. Gale, arrived in this country early last summer, and spent some time in the study of representative buildings in the principal cities. Mr. Gale came prepared to find American work much inferior to English; it is evident from his paper that he returned to England with a different impression. What was, perhaps, most surprising to him was the wonderful completeness of American houses and the elaborateness of their construction. He found American clients willing to pay for any comfort that could be procured.

In this city he devoted much attention to the work of the Board of Health and the improved tenement houses. The apartment houses were also a marked feature of the city. They were enormous blocks of buildings seven or eight stories high, and since 1879 80 had been strictly regulated by the New York Board of Health, some particulars of which organization were given. All classes of apartment houses were subject to the same regulations, and were constructed on much the same plans and lines, but in some a great amount of luxury was afforded the tenants. The entrance halls opened upon elevators with well cushioned seats, and running very easily, and the buildings surrounded a courtyard, covered in in the best examples. The walls were of brick, the roofs of iron covered with slates, the staircases of iron, and the floors of iron bedded in concrete, and laid with two thicknesses of boards. The finishing of all woodwork was excellent, and the joinery was superb, and constructed in a great variety of woods. Some of these dwellings were erected by mutual associations, who thus preserved some power of choice of tenants, and in many cases the choice of apartments was put up to auction. During the past year the plumbing arrangements had been regulated by the Board of Health, and the rules were fairly representative of American public opinion on the matter. A curious feature was that the soil-pipe was usually of iron, coated inside and out with enamel or coal-tar pitch. The use of iron allowed the pipes to be suspended from the cellar roof. Lead was condemned as being less smooth, more liable to corrosion, and less easy of jointing. Indeed, there was a general thoroughness about the use of iron pipes which was in advance of English practice.

The ventilation of buildings was, in many cases, very perfect, and he specially studied Dr. John Hall's church (Fifth avenue, Presbyterian), New York, of which M. Carl Pfeiffer was the architect. The building measured 200 feet by 100 feet, and was 60 feet high, being seated for over 2,000 persons. Two towers, each 100 feet high and 60 feet square, formed inlets and outlets for air. The incoming air was received in basement, and in cold weather passed over a set of steam pipes some 9,000 feet long, suspended from the ceiling, the whole basement being thus converted into a heating chamber. The warmed air came up into the pews and could be regulated by the occupants. Twenty-four hours before the service the steam pipes were heated, and throughout the Sunday a powerful fan was rapidly rotated in the outlet tower, drawing off the vitiated and heated air. The windows were all double and the gas burners protected in glass niches. In summer time the incoming air was passed over ice. A steam pump and fire hydrants were provided to prevent accidents. Madison Square Theatre was ventilated and warmed, or covered, by somewhat similar apparatus.

Other buildings which impressed Mr. Gale for their extent and elaborateness were the new public buildings at Philadelphia, Mr. MacArthur the architect, and the Mills Building in this city, Mr. George B. Post, architect. He regards the Johns Hopkins' Hospital, at Baltimore, designed by Dr. J. S. Billings, associated with Messrs. Cappett & Candler, of Boston, and Mr. J. R. Niernsée, of Baltimore, one of the most interesting structures of the kind in the world.

PERSONAL ITEMS

Dr. Paton, Smoke Inspector of Cincinnati, has been transferred to the position of Food Examiner.

General Egbert L. Viele will succeed Mr. Smith E. Lane as Park Commissioner of this city. General Viele was at one time Engineer-in-Chief of Central Park. In 1881 he prepared a report on Malaria in Western Connecticut, which is printed in the report of the State Board of Health of Connecticut for 1881.

Philadelphia Councils have elected Mr. John D. Estabrook chief commissioner of highways, bridges and sewers, in place of Mr. William Baldwin, deceased.

General Theodore G. Ellis, a well-known civil engineer, prominently identified with the proposed improvement of the navigation of the Connecticut River above Hartford, died at that city, the 9th inst., of pneumonia. For several years Gen. Ellis has had charge of the government improvements and surveys on the Connecticut River.

Governor Cleveland has appointed Mr. James Shanahan to be Superintendent of Public Works of this State, in place of Mr. Silas B. Dutcher.

The Supervisors of the town of New Lots have appointed Dr. Andrews Health Officer for the coming year.

STEAM FITTING AND STEAM HEATING.

BY "THERMUS."

No. XVII.

BOILER TRIMMINGS AND ATTACHMENTS.

(*Continued.*)

The Safety Valve.—The primary use of a safety valve on a steam generator is to relieve an excess of pressure; but aside from that, the noise it produces when steam is escaping makes it an auxiliary to the pressure gauge, by indicating that the maximum pressure has been reached, and that the immediate attention of the engineer is required, if not in the interest of safety, at least in the interest of economy.

A safety valve, to be sufficiently large, should be of such proportions that it will *let all the steam escape that the strongest fire is capable of producing when all the other outlets of the boiler are closed*, and for house boilers particularly, should the safety valve be calculated by a rule based on the *greatest* evaporation.

Engineers who have given sizes of valves for *power* boilers have not considered this question in its relation to *house* boilers, and nearly all have a different rule for the questions they do consider; with frequently very different results.

To a steam fitter who is looking for information on the subject, and who is confessedly ignorant of the aspects of the problem, this diversity must raise doubts as to the authenticity of some of the methods, and should he accept one as being the most reliable, without himself conquering the question, and being able to see it from each of the individual standpoints, he is liable to be guided by the general reputation of the writer as an engineer, and take it for granted that it is applicable to all cases, and apply it to *house-heating apparatus*.

All boilers should have ample safety valves, but with house boilers, which are automatically governed, and, as is customary, left for long periods without any one near them, the safety-valve must be the sole reliance should the self-regulating doors fail, and consequently must have proportions beyond a doubt. In ordinary practice with high pressure boilers or large boilers with flat sides (sometimes called low pressure boilers) with engineers in charge, not one in twelve will put implicit faith in their safety valve; and this only when the valve has to provide for *an excess of evaporation above the ordinary duty*. Their first impulse will be to close the draft doors, if they have any, and if not, to open the fire door, and in this they are prompted at first, as a matter of precaution, coupled, perhaps, with economy, which in time becomes a habit.

One high English authority allows 29 square inches of the circular disk of an ordinary valve, for a fifty horse power boiler. This valve is nearest to what can be purchased as a six-inch valve, and which, when we take into consideration the variations in formulæ for velocity of flow of steam through apertures, and that these velocities are based on the efflux through round holes or conoides, that the lift of the circular six-inch disk must be sufficiently great to allow an annular opening equal to ¾ of a square inch, and perhaps as great as 1⅓ square inches, for a pressure of 50 pounds above atmosphere; and, should the conclusions be correct which we draw from the experiments of Prof. Burg with a four-inch valve (*Vide* Trowbridge, "Heat Engines, and Baldwin's "Steam Heating"), we are not sure that it is possible to get an opening equal to the smallest above mentioned.

Another rule allows *one-half a square inch* of the circular disk for each square foot of grate, and though the writer is of the opinion the opening in valves should be proportional to the grate surface, the question will arise, why is not pressure taken into consideration, even assuming the half inch of the valve area to be sufficient? But is it enough? With ordinary boilers it is common to burn ten pounds of coal per hour on a square foot of grate, and should the coal

Digitized by Google

evaporate ten times its own weight of water (not an impossible thing) there will be 100 pounds of water evaporated to a square foot of grate in an hour, which will give a 50 H. P. boiler about 30 square feet of grate and 15 inches area of valve. According to Zeuner it will take 3,000 pounds of steam about an hour and a quarter to pass through a hole with a section of one square inch when the pressure is 50 pounds. No four and one half inch valve of common construction (the nearest to 15 square inches of disk) can give such an opening and the more I consider it the more I am inclined to repeat the words of a cotemporary, that "the ordinary safety-valve is only a *danger signal*."

According to an Act of Congress, for steamboats, etc., boilers with stayed surfaces are to have 30 square inches of disk area, for every 500 square feet of *effective* heating surface, and for cylindrical boilers 24 inches of disk for the same surface. The word effective is here taken advantage of, and a rule (by what authority it is difficult to understand) that about two-thirds only of all the surfaces of marine boilers is considered effective. Thus if we add 250 to the 500 mentioned we again have what might be called a 50 horse power boiler, with 30 inches of disk or a little more than a six inch valve. The law also regulates the size of "lock up" valves at 2 inches diameter of disk for 700 feet of effective surface or less; three inches for 1,500 feet; four inches for 2,000 feet; five inches for 2,500 feet and six inches for any boiler longer. Such valves of course are not expected to do much more than *sound an alarm*.

Rules which are based on the work done in an engine cannot be applied to boilers in apartment houses and stores, in which, though the latter have engines frequently, and both have large pumps for hydraulic elevators, the steam used in the cylinders seldom represents more than one-third of the water evaporated, the remainder being for warming, cooking, washing, drying and other purposes. Again rules based on evaporation which do not take pressure into consideration must be carefully sifted, and none used that will not provide for the taking away of all the steam at all ranges of pressure. Should a valve be found upon experiment to be just sufficient to relieve a boiler at 100 pounds of steam, the same valve would not do for ten pounds maximum pressure unless it had a very much greater rise at the lower pressure. Should the openings remain the same (according to one authority the velocities being about 1,200 feet per second for the low pressure and 1,900 for the greater with *relative volumes* at 1,060 and 260 respectively*) 2½ times the weight of steam and a little over (2.57) will pass at the 100 pounds, which of course would make it necessary to have the valve give 2½ the rise, nothing else considered, for the low pressure, the evaporation being the same.

Thus if a safety valve is of such construction that it opens to the *full area of the aperture, the valve may be many times smaller than ordinary rules call for*, and that low pressures will require larger valves than high ones, but with ordinary safety valves held to their places by *leverage* or a *spring*, and necessarily of large area the result is probably different, certainly so if Prof. Burg is correct, for according to his four inch valve blowing at 12 pounds of steam, the opening or lift is $4\frac{7}{10}$ times greater that when it is blowing at 90 pounds; and consequently making a valve or *common pattern* which would be enough for the high pressure thereby sufficient for a lower one.

[To be Continued.]

In accordance with the resolution introduced by Senator Daly, and passed by the New York Senate, providing for the appointment of five citizens to examine into a plan for the increase of the water supply of this city, Mayor Edson has named the following gentlemen: Orlando B. Potter, John T. Agnew, William Dowd, Amos R. Eno, and Hugh N. Camp.

* Other and apparently more scientific authorities give a very much higher velocity for steam than the above, but I think it is better to err on the side of safety.

MALARIA.

BY GEORGE M. STERNBERG, M.D., SURGEON U. S. A.,
Late Member of the Havana "Yellow Fever Commission" of the National Board of Health, Cor. Member of the Epidemiological Society, London; F. R. M. S., etc.

No. II.

After what has been said in the preceding article it is hardly necessary to insist upon the influence of seasons and of meteorological conditions as affecting the production of malaria. But it must be remembered that owing to the number of factors the problem is somewhat complicated and that the hottest season, or the period when the most rain falls, is not necessarily the most unhealthy. For heavy rains may check the development of malaria by filling the swamps with water. Or a long continued high temperature may be inefficient either from lack of moisture—rain—or of vegetable matter subject to decomposition. The fact that the malarial fevers are more rife in autumn than in mid-summer is probably due, in part at least, to the fresh supply of vegetable matter subject to decomposition from the crop of annual plants, the leaves of deciduous trees, etc., which fall to the ground at this season and accumulate, especially in low wet places.

Moreover, the season of vigorous growth having passed, the beneficial action of living plants, which earlier in the season consumed a portion of the products of decomposition, by means of their roots and leaves, is at a minimum.

It is evident also that the amount and direction of the wind is an important consideration with reference to the dissemination of the malarial poison. This accumulates during still, muggy weather at the localities where it is produced, but it is diluted and carried away by strong currents of air. Thus an impure atmosphere may be cleansed, or a locality ordinarily healthy may have malaria brought to it through the agency of atmospheric currents.

One who would explain all of the phenomena connected with the prevalence of malarial diseases over extended areas and during a series of years, will find it necessary to consider not only the meteorological conditions noted, but the hygrometric and barometric states of the atmosphere, the amount of ozone present, etc. And, also, the physical features of the surface of the earth and the changes in the same due to the cutting away or planting of forests, to engineering operations, railroads, canals, etc.—to varied agricultural pursuits, etc. When, however, these various items are duly considered it is doubtful whether a satisfactory explanation of all the phenomena can be given. For all of the factors involved in the production of these phenomena have not yet been stated.

There is still a biological factor. Until quite recently this factor has been entirely ignored by epidemiologists, who have consequently failed, for want of sufficient data, to explain the phenomena in question. But this factor complicates the problem enormously and it remains to be seen whether future efforts, made by those who recognize the importance of this element, so long unknown to science, will be more successful than those of their predecessors who depended mainly upon meteorological data.

Modern science has demonstrated that the putrefactive decomposition of organic material is due to living micro-organisms—known under the general name of Bacteria.

The most putrescible animal or vegetable matter may be preserved indefinitely, in the presence of oxygen and under favorable conditions as to heat and moisture, without undergoing the slightest putrefactive decomposition, so long as these micro-organisms are excluded.

If then malaria results from the decomposition of organic material of vegetable origin, which can scarcely be questioned, we are justified in saying *malaria is due to micro-organisms.*

Have we then answered the question, "What is malaria?" By no means. There are many different species of bacterial organisms engaged in this work of pulling to pieces organic structures—animal and vegetable—and a variety of more or less complex chemical products are evolved during the process. As yet we are uncertain whether malaria is due to the presence of one or more of these living organisms—"germs"—in an infected atmosphere, or to that of one or more of the chemical products of vegetable decomposition, evolved as a result of their vital activity.

Perhaps both hypotheses are correct, and that poisoning may result, directly, from the respiration of an atmosphere charged with certain chemical products of vegetable decomposition; or, indirectly, from the introduction of germs which, multiplying within the body, give rise to the same poisonous products. A third hypothesis is that the germs themselves are the poison.

A complete discussion of the observed facts and experimental evidence in favor of or opposed to these several hypotheses would require far more space than has been allotted to the present series of articles. Our object will, therefore, be rather to urge the importance of further experimental research, and to indicate the direction which this should take, than to attempt to decide the question from the data at present available.

A strong argument against the supposition that malaria is a gaseous miasm is found in the fact that it is not given off from the surface of shallow ponds, ditches, etc., although these may contain an abundance of vegetable material undergoing decomposition. In water from such a source we find, however, a great quantity and variety of bacterial organisms, and there is ample evidence that malarial fevers may be contracted as the result of drinking marsh-water. Thus *Boudin* reports that "of 120 soldiers who returned from Bona to Marseilles on the ship Arago, in the year 1834, 103 were attacked with the most various forms of malarial fever, some of them pernicious, because during the voyage they drank of the marsh-water that was taken on board at Bona. On the other hand, the sailors of the same ship, who had good water, and 780 men who were embarked on two other vessels, remained well." (Hertz, in Ziemssen's Cyclopædia, vol. II., p. 586.)

The researches of Carmichael, Wernich, Miguel, Pumpelly and Smyth, and others, show that germs are not given off from a liquid containing them when this is at rest. They may be projected into the atmosphere, however, by bursting bubbles of gas. Again, the fact that the symptoms of malarial poisoning do not, usually, manifest themselves immediately after exposure to a malarious atmosphere but that the characteristic febrile attack is not developed until some time after such exposure—period of incubation—and that a first attack, or a relapse, may occur many days or even weeks after removal to a perfectly healthy locality, is hard to reconcile with the hypothesis that malaria is a non-living, chemical miasm; but it may be explained upon the supposition that the infecting agent is a living germ, capable of multiplication within the body of the infected individual.

The view, however, that this hypothetical germ finds a suitable pabulum for its development in the blood and that it is by its presence in the circulating fluid that it gives rise to the phenomena of the disease seems to the writer to be untenable for the following reasons:

(*a*) *A priori* we should hardly expect to find a germ whose normal habitat is in marshes and which develops at the expense of organic matter of vegetable origin, thriving in an animal fluid.

(*b*) But if this fluid is suited to the development of the malarial germ, how does it happen that a few germs introduced into the system, by respiring a malarial atmosphere, do not invariably multiply abundantly and produce the most serious form of malarial poisoning? In those diseases in which the blood is invaded by parasitic organisms—*e. g.*, anthrax, chicken-cholera, septicæmia in the rabbit, etc.—a small dose is as potent as a large one. For the capacity for rapid self-multiplication in a suitable culture-medium causes the result to be the same whether a small or large number of germs are introduced in the first instance. Moreover, these germ-diseases are all communicable from one animal to another and a single non-fatal attack protects from subsequent attacks. In the malarial diseases, on the other hand, the severity of the symptoms seems to correspond with the quantity of the poison introduced into the system; and one attack predisposes to another instead of protecting against it; while there is no satisfactory evidence that a person suffering from the most severe form of malarial poisoning can communicate the disease to another.

(*c*) Microscopical examination, in the writer's experience, does not sustain this hypothesis. For *in no instance have I been able to discover micro-organisms in the blood of malarial fever patients, although I have repeatedly looked for them with a first-class modern objective* (one-eighteenth inch homogeneous immersion objective of Zeiss).

It is admitted, however, that, an amœba-like organism, like that described by Laveran, might have escaped observation, as the search was directed more especially to the discovery of bacterial organisms such as the *Bacillus malariæ* of Klebs and Tommasi-Crudeli. Since the

Digitized by Google

publication of Laveran's paper (*Comptes Rendus*, XCIII. (1881) pp. 627–'30), the writer has had no opportunity for studying, microscopically, the blood of malarial fever patients, and is therefore unwilling to express an opinion as to the value of the alleged discovery of a specific parasitic organism—the so-called *Oscillaria malariæ*—found only in the blood of those suffering from malarial poisoning. Quite recently (*Comptes Rendus*, XCIV. (1882) pp. 496–'9), M. Richard has published confirmatory observations. According to this author the parasite invades, and undergoes development in, the red corpuscles of the blood. Whether this latest discovery will bear investigation any better than those which have preceded it remains to be seen. But further confirmation is required before it can be considered *un fait établi*.

With reference to the *Bacillus-malariæ* of Klebs and Tommasi-Crudeli, we may be permitted to remark that sufficient time has elapsed since the publication of the mémoir of these gentlemen (1879) to justify us in looking for confirmation from numerous independent sources if any such organism as they obtained from malarial localities in the vicinity of Rome, cultivated in fish-gelatine solution, and injected into rabbits, is to be found in the blood of patients suffering from malarial fevers in other parts of the world.

The result of the writer's own researches, made in New Orleans during the months of September, October and November, 1880, under the direction of the National Board of Health, are given in the following extracts from his published report (Supplement No. 14, N. B. of H. Bulletin).

"Among the organisms found upon the surface of swamp-mud, near New Orleans, and in the gutters within the city limits, are some which closely resemble and, perhaps, are identical with the *Bacillus-malariæ* of Klebs and Tommasi-Crudeli; but there is no satisfactory evidence that these, or any other of the bacterial organisms found in such situations, when injected beneath the skin of a rabbit, give rise to a malarial fever corresponding with the ordinary paludal fevers to which man is subject."

"While, however, the evidence upon which Klebs and Tommasi-Crudeli have based their claim to a discovery is not satisfactory and their conclusions are shown not to be well founded, there is nothing in my researches to indicate that the so-called *Bacillus-malariæ*, or some other of the minute organisms associated with it, is not the active agent in the causation of malarial fevers in man. On the other hand there are many circumstances in favor of the hypothesis that the etiology of these fevers is connected, directly or indirectly, with the presence of these organisms or their germs in the air and water of malarial localities."

[TO BE CONTINUED.]

THE BARBER ON THE MILWAUKIE FIRE.

"Well, what's the news?" the reported asked as the German barber near the Cooper Institute tucked the towel in place.

"Vell," said the barber, "der news in der bapers und in der parber shops is all der dime choost der same. It's brincipally apoud der Irish fife days in der veek. Somedimes der golera, a murder, an election, or a high-doned sdade of affairs in der Union Glub preaks owid und Ireland gits growded by von gorner. Bud right avay it preaks owid some more alretty, and for a veek or dwo id vos all Irelant. Milvorkee growded owid der Irish dis veek. Py chimaneddy, dot vos a pig oxsidemend, aind it?

"I haf seen py a leedle down in Chermany a pig house a-fire. Drying mit oil to vill a purning lamp vos der consdidution of it. Der vlames chumped der whole house insite, und der poy ran for der purgomaster. In der old goundry you haf der purgomaster to find pegause he der key by der enchine house keebs. He vos der down oudsite by der goundry, but py und py der poy vound him. Afder dot der merchants vich to der enchine gumpany pelong vent home und put on der pig helmets und dings vich must pe worn at a fire. Negst, der machines vos py der vire tragged alretty, und der peeple vent und got owid der pig vorter parrels on veels, but der sdreeds vos so rough der vorter bretty near all sbilled owid. Py dot dime der house vos purned down, und efferypoddy had so much drouble for nodding.

"Vell, you dink dot was breddy pad, aind it? My goot vrend, id vos more pedher for human life in der olt gundry than it peen py Nye Yorick. Der beeple tond got such a graze for insurance ofer dere, und fires aind so gommon. Der pilders must go to chail choosd like der rest ov der scountrels if dem dry to make insurance dake der blace ov bricks und mordar. Here, mit a leedle money und a pig morkage der valls go up, und der garpenders und masons keep guied und spik in a visper for fear der house vill pefore it vos finished fall down. Afder dot it is vell insured, und in den years der lantlort says, 'I haf got dwice owid of it vot it gost, und it is olt-fashioned now. I vood not purn it town, put it vood pe a bartickler vavor if Broffidence vill set fire to it.'

"Ven a man has such a vaith in Broffidence like dot he can zet fire to mountains.

"Insurance is doo much of a goot dings. Don't you dink if ve coot vix it so dot any man vot got der tirlirium chim-chams should come owid richer then he vent in dot der chim-chams vood pe right away more gommon alretty?—*The New York Sun.*

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.

E. G. LOVE, Ph.D., *Gas Examiner.*

INCANDESCENT ELECTRIC LIGHTING.

JERSEY CITY, *Jan.* 6, 1883.

To the Editor of THE SANITARY ENGINEER:

Now that the Edison Electric Light Company have given their prices for incandescent lighting, it becomes a very simple problem to determine the relative value for illumination by the incandescent light and gas.

Take their price for incandescent lighting at one dollar for one thousand candle-power, burning one hour, and gas at the rate of $2.25 per thousand cubic feet, we have the following results; to illustrate which, I will take the statement of the correspondent of THE SANITARY ENGINEER, Jan. 4, wherein he gives the bill rendered E. P. Coby & Co. for incandescent lighting, as 13,264 candles at $1 per 1,000 candles =$13.26 It is a well-known fact that the gas furnished by the Mutual Gas Light Co. is equal to 25 candle-power—*i. e.*, a burner consuming five cubic feet per hour gives a light equal to 25 candles or one cubic feet of gas equals five candles; it follows, therefore, that 2,653 cubic feet of gas would be equal to 13,264 candles by the incandescent light.

The account would stand thus:

13,264 incandescent candles at $1 per thousand.....	$13.26
2,653 cubic feet of gas at $2.25 " ".....	5.96
Saving by using gas.....	$7.30

Having discussed the economy of incandescent lighting and gas, let us look for the merits of the arc light, compared with gas.

While the writer believes that the arc can be used with great economy, in the lighting of public parks and large areas, where the whole power of the light is utilized, he knows that for street lighting gas has the advantage over the arc light; in the arc light there is so much of the light intercepted by buildings, and to subdivide this light would make its cost almost equal to the incandescent light: a great blaze of light at one point is not necessary nor is it pleasant; the great desideratum in street lighting is to have them uniformly lighted. CANDIDUS.

ELECTRIC LIGHT NOTES.

A Canadian company, under the title of the Canadian Electric Light Company, will compete for the lighting of Montreal.

In reply to a communication from the Fire Commissioners of Cincinnati, with reference to the dangers of electric light wires to firemen, the Brush Company have appointed a committee of conference to meet the commissioners.

At Bradford, England, the corporation applying for a provisional order to light the borough, propose to charge for the electric light a price equivalent to $1.50 per 1,000 cubic feet of gas. This is said to be double the price at which gas is now supplied.

The electric lighting of Rochester, N. Y., has now progressed to the lighting of Main street, which is brilliantly illuminated, according to the local papers, by the lamps.

The Brush Co. has challenged the United States Electric Light Co. to a public test of their systems, in Louisville, Ky. The loser is to pay $1,000 toward the expenses of the exhibition and $4,000 to the Polytechnic Society of Kentucky.

The Savannah, Ga., Board of Aldermen, the 7th inst. authorized the Brush Electric Light and Power Company to erect masts and towers in accordance with their contract for lighting the city.

A dispatch from Cleveland, O., states that the city is discussing the abandonment of the electric light on account of its cost. More light is given, but at a higher price. On Euclid Avenue eight mast Brush lights, costing $13,200 per annum, have replaced 75 gas lamps costing $3,300.

The Chamber of Commerce, of Milwaukee, immediately after the fire at the Newhall House, addressed a letter to the Mayor requesting him to take steps to bring a petition before the State Legislature and City Council for legislation compelling telegraph companies to put their wires underground in the business centre of the city. They claim that the obstruction of the wires to the firemen caused increased loss of life.

Meter-ites.

In connection with the Marine and Mechanical Exhibition, to be opened in London next July, there will be an exhibition of apparatus illustrative of gas, water, electric, and telegraph engineering.

The negotiations for the amalgamation of the Gas Light and Coke and the London Companies has fallen through. The chief difficulty was the division of the London Company's district between the Chartered and South Metropolitan Companies.

The Hartford Steam Company is seeking such an amendment of its charter as will permit the manufacture of gas of cheap grades, for heating purposes. We have before noticed other cases in which steam companies in different cities of the Union are seeking to obtain authority to supply gas.

Mr. W. Foster, in an article in the *Journal of Gas Lighting*, on the production of ammonia in gas manufacture, gives the total amount of nitrogen in coal as 1.73 per cent. Of this amount, 16 per cent. is evolved as ammonia and cyanogen in gas manufacture, 50 per cent. remains in the coke, and the balance is unaccounted for.

The report of the Superintendent of Lamps of the City of Boston for the year 1882 shows that there were at the close of that year 12,967 oil, gas and electric lamps, in different sections of the city, an increase of 71 over the preceding year. The gas lamps, owing to the introduction of the electric light, show a falling off of 149. The electric lights of the Brush Company were introduced in February, 1882, and there are now 59 of 2,000 candle power each in use, for which the city pays 65 cents per lamp per night. These lights have given satisfaction. In May the city entered into a contract with the New Eng'and Weston Electric Light Company, so now has 57 lamps of 2 000 candle power, for which it pays 58 cents per lamp per night. These have not, however, been satisfactory, which the Superintendent attributes to want of proper care and management. A table of prices paid for gas since 1875 is given, from which it appears that the city proper paid in 1875 $2 08½ per 1,000 cubic feet; in 1882 $1 50; prices in the other districts ranged from $2 50 to $3 00 in 1875, to $1 87½ to $2 25 in 1882. To private consumers the price now ranges from $1 80 (the Boston Gas Light Company) to $3 00 (the Jamaica Plain Gas Light Company.)

EXPLOSION OF A STEAM TABLE.

This morning about quarter past seven, a singular accident occurred in the kitchen at the Lochiel Hotel. One of the adjuncts of the kitchen is a long table, the top of which is hollow and contains spaces on which dishes of meat, etc., are placed to keep them warm. The table is heated with steam, which is forced through it from the engine and escapes at one end. This morning the escape was shut off by some means entirely inexplicable, and the steam was forced into the table until it could hold no more, in consequence of which there was an explosion, accompained by a loud report. The seams of the table were forced open, the legs twisted and bent and the whole room filled with steam. Dishes were thrown into the air, and things were scattered about promiscuously, but fortunately no one was near enough to be injured. The damage was instantly repaired, and things moved along smoothly in a short time.—*Harrisburgh Telegram, Dec.* 13.

[Improvised steam tables are generally unsafe. All steam tables have large flat surfaces, which we believe to be seldom braced or stayed, the stiffness of the metal of the top and bottom being depended on, reinforced, perhaps, by a rib. No engineer will construct a water leg or any other flat surface for a boiler, say 30" by 60" and not brace it, and yet they will rig up the most flimsy contrivances for purposes such as above.—ED. SAN. ENG.]

Food and Drugs.

BOARDING HOUSES AND THE ADULTERATION LAW.

To the Editor of THE SANITARY ENGINEER:

Your paper of Jan. 4, 1883, has been handed to me; I am pleased to see that in it you advocate pure air, also pure food and drink, so essential to health. Your kindness in answering the question from a grocer as to the standard of pure cream tartar induces me to ask you if the hotels, restaurants and boarding house keepers can be punished for using adulterated articles of food, etc. After reading the reports from the different chemists, stating the various articles found in adulterated spices, especially pepper and mustard, I made up my mind to sell nothing but pure goods. Of course I had to pay and sell at a higher price than when I sold impure goods. I had trade with hotels, restaurants, and boarding houses who complain that the price I ask for pepper, for instance, is so much more than they can buy at other stores. I do not now sell them. That you may see I do not ask an exorbitant profit, I give 23 cts. per lb. for my pepper and sell it at 28 cts. per lb.; for mustard I pay 30 cts. per lb. and sell at 40 cts. per lb., which I think is as small a margin of profit as I can live upon and pay 100 cents to the dollar. Now, Sir, why should not the hotels, restaurants, and boarding houses be compelled to give to their customers pure spices, mustard, etc., as well as the grocers who sell direct to the public?

Your answer will oblige another GROCER.

[We believe that hotel or restaurant keepers who furnish their guests with adulterated articles of food are liable under the law, and if prosecuted, we think the courts would so decide. The policy of, at this time, enforcing the law in that direction is a matter for the State Board of Health to decide upon. We should consider that more could be gained in other ways.]

IMPORTATION OF INFERIOR TEAS.

We have received the following communication, petition and bill to secure legislation to prevent importation of inferior teas;

It is asserted that since England has prohibited the importation of unsound tea for home consumption, the United States is used as the only dumping ground for it.

In the year 1880, 36,195 packages were forbidden to be cleared for home use in England, and 6,225 packages were condemned as unfit for food. In the year 1881, 44,443 packages were forbidden to be entered for consumption in England, but was allowed to be exported, part of which found its way to America.

As the differential duty will cease on the first of January, 1883, undoubtedly more if not all of this rubbish will be sent to America.

This tea is now principally sent here on English account from China, and sales to dealers by private contract is almost impossible.

The unsound tea is forced into the country by public auctions, and under various disguises palmed off on the poorer and working classes.

Legislation only can give them relief.

To the Honorable, the House of Representatives:

We, the undersigned dealers in tea, respectfully petition your honorable body to relieve us from a grievance which has become too serious to be borne.

Several years since, England enacted a law prohibiting the importation of all adulterated teas. This embraced all teas of inferior grades whose chemical properties are injurious to public health. Now, the markets of the United States are overstocked with this refuse and tea dregs from China and Japan.

The yearly importation of tea is about eighty million pounds; of this quantity fully twenty per cent. is too inferior for healthy consumption, objectionable in every sense.

The yearly consumption of tea in the United States is about sixty-five million pounds. With the exclusion of the adulterated stock there would be sufficient good tea to supply the needs of the people, and a healthy action would result.

We ask for the enactment of laws prohibiting the importation of adulterated teas.

As a sanitary measure it demands attention, and will repay the little expense entailed by the appointment of sanitary inspectors.

For relief from this burden your petitioners will ever pray.

A BILL

TO PREVENT THE IMPORTATION OF ADULTERATED TEAS.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That from and after the first day of July, eighteen hundred and eighty three, it shall be unlawful for any person or persons, or corporation, to import or bring into the United States, for the purpose of sale, any adulterated tea; and the same is hereby prohibited.

SEC. 2. That all tea, or other substance under the name of tea, imported from abroad, shall, before passing the custom-house, be examined and appraised, as well in reference to its quality and purity, as to its value and indentity specified in the invoice.

SEC. 3. That if, on examination, any tea is found, in the opinion of the examiner, to be adulterated, or so far affected by chemicals as to be unfit and dangerous for use, a return to that effect shall be made upon the invoice; and the tea, or article called tea, so noted shall not pass the custom-house, unless, on a re-examination, called for by the owner or consignee, the return of the examiner shall be found erroneous.

SEC. 4. That if upon such re-examination the tea shall be found to be adulterated, it shall remain in charge of the collector, and the owner or consignee, on payment of the charges of storage and other expenses necessarily incurred by the United States, and on giving a bond, with sureties satisfactory to the collector, to land the said tea, or article called tea, out of the limits of the United States, shall have the privilege of re-exporting the same at any time within the period of six months after such re-examination; but if the same shall not be sent out of the United States within the time specified, the collector, at the expiration of that time, shall cause the same to be destroyed, and hold the owner or consignee responsible to the United States for the payment of all charges, in the same manner as if the said tea had been re-exported.

SEC. 5. The examination and appraisement herein provided for shall be done by an appraiser of the port to which said tea is entered, and when entered at ports where there are no appraisers, such examination and appraisement shall be made by the revenue officers, to whom is committed the estimating and collection of duties, unless the Secretary of the Treasury shall otherwise direct.

"Herr Richter very tersely informed Bismarck, the other day, that the prohibition of the importation of American pork was much less a sanitary than a protectionists' measure."—*Savannah News.*

In compliance with the recommendation of Gen. Thayer, Superintendent of Fairmount Park, two tug boats have been put to work breaking the ice on the Schuylkill river, above the Fairmount Water Works dam, to keep the river channel open to allow the air to purify the water. As soon as the ice on the sides of the river is sufficiently thick it will be cut and removed by the Knickerbocker Ice Co.

THE McCLOSKEY TRAP VENTILATING PATENT SUIT.

In the following abstract from the records in the McCloskey patent suit we have given the testimony only of those witnesses whose evidence proved that the feature patented by Mr. McCloskey had been in actual use in buildings in the United States two years prior to the filing of his application for a patent.

The other evidence submitted, while in our opinion sufficient to invalidate the patent, yet gave hope to the plaintiffs because it was claimed that the recommendations and illustrations in THE SANITARY ENGINEER, the Massachusetts State Board of Health Report, and other publications that appeared prior to his application for a patent did not amount to proof of actual use in the United States, but were of the nature of recommendations, and that unless the system could be found in actual use in houses two years prior there was no evidence that the American public had adopted the advice contained in the published suggestions and had made such use of the idea as the law contemplated. To avoid the delays and expense of introducing English evidence that McCloskey was not the first inventor, efforts were made to ascertain instances of the two years' prior use in this country, which evidence could not be procured in this city. Boston and San Francisco, however, were able to supply it. Want of space, therefore, will oblige us to limit our quotations to the testimony of the witnesses from these cities and to the illustrations they submitted in evidence.

It is but just to state that Messrs. E. S. Philbrick, James A. Tucker and Isaac Riley of Boston, and George Milne of San Francisco, whose testimony will be found below, voluntarily gave much time to this case at considerable personal inconvenience, and we desire to acknowledge our indebtedness to them therefor.

CIRCUIT COURT OF THE UNITED STATES,

SOUTHERN DISTRICT OF NEW YORK.

[IN EQUITY.]

JOHN MCCLOSKEY
vs.
JAMES H. YOUNG.

Proofs for final hearing taken on the part of the defendant, under and pursuant to the 67th Rule in Equity, before Joseph Gutman, Jr., Examiner.

NEW YORK, *June* 3, 1881—11½ A. M.

Present—C. WYLLYS BETTS, ESQ., counsel for defendant.

EDWARD S. PHILBRICK, a witness of lawful age, produced on the part of the defendant, having been by me first duly cautioned and sworn to testify the truth the whole truth and nothing but the truth in the matter of controversy herein, and being examined by Mr. Betts, deposes and says:

1 *Q.* What is your name, age, residence and occupation?

A. My name is Edward S. Philbrick; I am 53 years old; I reside at Brookline, Mass.; I am a civil engineer.

2 *Q.* Are you acquainted with the system or systems of draining houses by the use of traps and other matters connected with drainage, and if so, for how many years have you been familiar with it?

A. I have been familiar with it all my life, and have made a special study of it the last six years.

3 *Q.* Did you ever see any traps connected with basins or water closets which were ventilated in any manner; if so, please state when you were so familiar, and describe such trap or traps?

A. In the year 1875 I built two houses in Brookline, Mass., where I applied a ventilating pipe to the trap receiving wash bowl wastes, above which water closets were connected to the same main soil pipe.

4 *Q.* Please describe the system of ventilating these traps as employed by you in these two houses in Brookline in the year 1875, and illustrate the same by any drawing you can produce.

A. The vent pipe above referred to was attached to the top or outlet of the trap beneath the floor, and extended across the adjacent room under the floor to a special flue constructed in the chimney, through which it communicated to the open air above the roof. The soil pipe had another opening to receive air by an air valve, which opened inward only near the water closet. This is described by a drawing which I produce, marked Exhibit

Digitized by Google

Philbrick 1,* in which the pipe marked "vent pipe" is the ventilation pipe above referred, and the valve is marked "air valve."

5. *Q.* What was the size of that ventilation pipe leading from the soil pipe to the flue?

A. Either an inch and a quarter or an inch and a half; I don't remember which.

6 *Q.* How do you know that it was in the year 1875 that this ventilation pipe was so used by you?

A. I remember seeing it put in; I superintended the work myself.

7 *Q.* Is there any circumstance by which you can definitely determine that it was prior to the year 1876?

A. Yes; I know I leased the house for five years, beginning Nov. 1, 1875, and that I renewed the lease last November, after its expiration. The house was completed before Nov. 1, 1875, when the occupation began.

8 *Q.* What was the character of the use of this trap, as to whether it was public or private?

A. There was no secrecy about it. The specifications requiring it were submitted for competition to competitive bidders. The same practice had been in use in England previously.

9 *Q.* When did you next see a ventilated trap, and what was its use, and where was it?

A. The next case, of which I have definite record, was at the house of Dwight Foster, in Boston, No. 18 Chestnut street, where I was employed by the proprietor to execute certain improvements. I there applied ventilating pipes to several traps on different stories or floors, combining them into one pipe, which entered to the soil pipe under the roof, essentially as shown in the drawing Exhibit Philbrick 2. I did this work through Messrs. Hawthorn & Tucker, plumbers, of Boston. This work was done in September, 1876, as I find by reference to my diary.

10 *Q.* Please describe the character and material and uses of each of the parts of the traps, soil pipes and other connections which you placed in the house of Dwight Foster, in September, 1876, referring to the drawing Philbrick 2.

A. These ventilating pipes were of lead, from an inch to an inch and a half diameter inside; they were attached to the traps at their outlets, just below the water seal—that is, attached to the top of the arch of the traps on the side next the soil pipe, as the water flange furthest from the basin or closet. They served to supply the normal atmospheric pressure to each trap by their communication with the atmosphere above, and thus prevented the risk of the traps being syphoned and losing their water seal when in use by a partial vacuum which might otherwise be created at those points. If so syphoned, the sewer gas would gain admission immediately to the house. It also answered as a vent or means of escape for any bad gas which might accumulate in the outlets of these traps.

This arrangement was affected by a lead ventilation pipe, separate from the soil pipe, connected by branches to each of several traps and connecting with the soil pipe above the highest point where drainage was admitted into it; as marked in the drawing Philbrick 2, by the words "ventilation pipe."

11 *Q.* What was the character of the use of these traps with the ventilating pipes connected as described?

A. No attempt at secrecy and no thought of secrecy was entertained. I considered it a matter of public practice.

12. *Q.* What was your next knowledge of the use of ventilated traps—give the date and place where used, and describe the same with reference to any drawing you may have, or other description?

A. In the autumn of 1876 I built a house at the corner of Walley and Irving streets, Brookline, Mass., which I still own. The drawings and specifications were prepared in my own office, by myself, and I superintended the construction personally. The specifications and drawings were submitted to competition. I have here with me the original copy of the specification, from which I read as follows: "In the bath room the wastes from the bowl and tub shall each have a separate cast lead S-trap directly below, made easy of access and provided with a vent branching into soil pipe above." I remember seeing the work done exactly as above described. This is found on page 30 of the specifications.

On page 31 as follows:

"The soil pipes to be of cast iron, four inches diameter, with caulked lead joints, from the outside of the cellar to and through roof and for about two feet above the roof, where its open end is to turn down." I remember seeing the sink constructed as above, except that the extension of the soil pipe was made above its upper inlet, for drainage, of two inches diameter instead of four.

On page 33:

"The waste pipe from kitchen sink shall have a vent of one-inch lead pipe from the top of the air space in its trap connecting with a two-inch pipe through the roof." I remember seeing this constructed as above specified, except

COMPLAINANT'S EXHIBIT I.

J. McCLOSKEY.

SEWER-PIPE CONNECTION, &c.

No. 218,891. Patented Aug. 26, 1879.

WITNESSES:
Henry Eichling.
Charly Albreckt.

INVENTOR:
John McCloskey.

* This exhibit, showing ventilation of a single trap, we have omitted.

Digitized by Google

that instead of passing through the roof independently, the vent pipe was branched into the extension of the soil pipe above the bath room floor.

The above work was all provided for in the contract and performed by Messrs. Hawthorn & Tucker, for the sum of $375, in connection with other contract work. In addition to this, a sink was constructed in the china closet, or butler's pantry, with a special trap directly under it. A ventilation pipe, one inch diameter, extended from the top of this trap to the similiar vent which served the trap of the wash bowl in the bath room, on the floor above, referred to in the first quotation from the specifications.

The traps, vent pipes, and fixtures, as described above and as constructed, are shown on a drawing which I produce, marked Exhibit Philbrick 3.

Defendant's counsel offers in evidence the three drawings produced, referred to as Exhibits Philbrick 1, 2, and 3, and also the original specification from which the above extracts were read, and which is marked Exhibit Philbrick Specification.

A. As far as I can understand the model, the arrangement and connection of pipes for ventilation of pipes, etc., is essentially similar in this model and in the two houses referred to. It differs only in the relative position of the traps to each other, which is accidental in each case.

16 *Q.* Have you ever published any account of ventilated traps in connection with house drainage; if so, please state when and where?

A. I wrote a paper for the Massachusetts State Board of Health in 1875, which was published in January, 1876, in their Annual Report to the Legislature of the State. In that paper, on pp. 452, 453 of the State Report, I described the propriety of an arrangement substantially similar to that which I applied in the houses described above, and illustrated it with a diagram contained in said Report facing page 453.

The State Report referred to by the witness is offered in evidence and marked Exhibit Annual Report, 1876.

17 *Q.* Please look at the Letters Patent granted to J. McCloskey, August 26, 1879, No. 218, 891, for improvement in sewer pipe connections, and state whether you are familiar with the same, and if so, please compare the same with the system of traps, ventilation pipes and soil pipe described in your previous testimony and in the report of the State Board of Health for 1876, and give the reasons for any opinion you may express.

A. I have examined the Letters Patent referred to several times. I have never been able to discover in it any point or combination which I have not previously practiced in the instances above described, except the extension of the gas or vent pipe marked *C* to the open air near the foundation of the house, and for that I see no practical use or advantage.

The combination of vent pipes with the traps communicating with the open air above, through the soil pipe or otherwise, as described in the patent referred to, is precisely similar in all its essential features to the construction in the houses I described above, as used by me in the year 1876, and recommended in my paper, published by the State Board of Health above referred to.

18 *Q.* Have you any interest in this controversy?

A. None, as between the plaintiff and defendant, whatever.

19 *Q.* Was the use in the ventilated traps in the houses described by you in any sense experimental?

A. I did not consider it so. I felt very sure of its operation, as governed by well-known physical laws, before applying it to the first house, in 1875, and the results were entirely successful. The apparatus above described was in each case built in a permanent form, and is still remaining in those houses unchanged.

20 *Q.* Was the use of these ventilating pipes in connection with the traps and soil pipes, as above described, in any sense private?

A. It was not; they were all used in the most public manner possible, considering that they were used in private houses.

EDW'D S. PHILBRICK.

EXHIBIT PHILBRICK 3. J. G., JR. Ex'r.
House in Brookline on corner of Walley & Irving Sts, built 1876.

Sworn to before me,

JOSEPH GUTMAN, JR.,
Examiner.

NEW YORK, *June* 6, 1881—10:30 A. M.

Present—F. H. BETTS, ESQ., counsel for defendant.

JAMES TUCKER, a witness of lawful age, produced on the part of the defendant, having been by me first duly cautioned and sworn to testify the truth, the whole truth, and nothing but the truth in the matter of controversy herein, and being examined by Mr. Betts, says:

1 *Q.* What is your name, age, residence, and occupation?

A. My name is James Tucker; I am 45 years old; I reside at Boston, Mass.; I am a plumber.

13 *Q.* When was this work, described in your last answer, commenced and when completed, and how do you fix the date?

A. It was commenced November 15, 1876, and finished February 3, 1877, and paid for February 8, 1877, as I find by the bill which I produce.

Bill referred to offered in evidence, and marked Exhibit Hawthorn & Tucker's Bill.

14 *Q.* What were the uses of the ventilating pipes connecting the traps with the soil pipe, as above described?

A. The same as described in my answer to question 10.

15 *Q.* Look at the model marked in this case, Complainant's Exhibit No. 2, R. T. Van Boskerck, and compare it with the system of traps and ventilation which you have described as existing in the year 1876, in the house of Mr. Foster, and as completed February 3, 1877, in your own house.

Digitized by Google

2 *Q.* How long have you been a plumber?

A. Since April, 1860; a portion of the time I was absent in the army—four years and six months.

3 *Q.* How old were you when you went into the plumbing business?

A. Not quite fourteen years old.

4 *Q.* Have you been a member of any firm in your business, and if so, what?

A. In 1868 I was a member of the firm of Wilson & Tucker; in 1872 I was of the firm of Hawthorn & Tucker; in 1881 Tucker & Titus, which is in existence now.

Recess taken till 11:30 A.M., to enable counsel to attend the opening of the United States Circuit Court.

11:30 A.M.—same day.

Present—Counsel as before.

5 *Q.* Did you ever do any work as plumber under direction of Mr. E. S. Philbrick, of Boston?

A. Yes, sir.

6 *Q.* Please state some of the places in which you put plumbing work under the direction of Mr. Philbrick?

A. In Judge Dwight Foster's house in Chestnut street—No. 18 or 16, I forget which—and in his own house, Mr. Philbrick's own house in Brookline, Mass.

7 *Q.* State when you did the said plumbing work to Judge Dwight Foster's house?

A. I commenced the job August 16, 1876, and finished it on September 16, 1876.

8 *Q.* When did you do the work for Mr. Philbrick in the Brookline house?

A. I commenced November 15, 1876, and finished February 3, 1877.

9 *Q.* Please describe the character and construction of the plumbing work which you put into Judge Foster's house in August and September, 1876?

A. There were three water closets in the house and one stack of soil pipe; this main stack was run out through the roof, from the lower closets, first story; from the outside of the lower trap an air pipe was connected with the soil pipe above the upper closet, receiving in its passage air pipes from the other two closets,

10 *Q.* Have you here a drawing showing the arrangements of plumbing connected with said water closets in said house, if so please produce it.

A. Yes, sir.

Witness produces a drawing, which is offered in evidence, marked Exhibit Tucker Drawing, No. 1.

11 *Q.* Please mark the soil pipe in said drawing with the letter S,

The witness does so.

12 *Q.* Please mark the air pipe which you have referred to with the letter *a*.

The witness does so.

13 *Q.* Please mark the air pipes from the two upper closets which connect with the first named air pipe with the letters *a' a'*.

The witness does so.

14 *Q.* What was the object and purpose of using the pipe *a* and connections *a' a'*?

A. To prevent the entry of sewer or foul air through the fixtures—through the closets—into the house.

15 *Q.* From what portion of the traps of the several closets did these air pipes *a* and *a' a'* run?

A. From the outside of the traps; I mean on the other side between the water and the sewer.

16 *Q.* Is the point of connection of the air pipes *a* and *a' a'* correctly shown in the drawing Exhibit Tucker Drawing?

A. Yes, sir.

17 *Q.* Do you know how long the construction and system of plumbing in Judge Foster's house, as shown in Exhibit Tucker Drawing No. 1, continued in use?

A. Until the present time, until I left Boston on Sunday last; from 1876 to that time.

18 *Q.* How lately have you examined it?

A. I made this drawing on the premises (Exhibit Tucker Drawing 1) within six months.

19 *Q.* State how the said system and construction of plumbing has operated in said house with reference to the exclusion of sewer gas?

A. It has been a success.

20 *Q.* Please examine the drawing marked Exhibit Philbrick No. 2 and state if that correctly represents the same construction and system of plumbing, viewed from a different side, as that represented by your drawing?

A. Substantially.

21 *Q.* Please describe the construction of plumbing placed by you in Mr. E. S. Philbrick's house in Brookline?

A. The soil pipe was run similar to the other; it was run from the sewer to the roof. The air pipe from butler's sink bowl in bath room and kitchen sink connected above the second story water closet, making the air pipe from butler's sink and bowl and kitchen sink connected with the same stack of pipe above the second story water closet.

22 *Q.* Please examine the drawing marked Exhibit Philbrick 3, and state how that corresponds with the construction and arrangement of the plumbing in said house of Mr. Philbrick?

A. It is correct, substantially.

23 *Q.* Are the points of connection of the air pipes with the several traps correctly shown in said drawing?

A. As near as I can remember.

24 *Q.* Please look at the bill put in evidence in this case, and marked Exhibit Hawthorn & Tucker Bill, and state what that is?

A. Those are the charges for the work shown on Exhibit Philbrick 3.

25 *Q.* When was that identical bill made out?

A. February 8, 1877.

26 *Q.* When was it paid?

A. On the same date.

27 *Q.* Have you put the same construction of plumbing with ventilating pipes from the outside or upper portion of the trap, in any other houses or buildings in Boston?

A. Yes, sir.

28 *Q.* Please mention some of them?

A. I have done it in a number; I can't precisely remember the names.

29 *Q.* How early did you know of the same arrangement of ventilating pipes from the outside or upper portion of the traps being used in Boston?

A. I have seen it between 1852 and 1853, in the Thorndike Building, in Summer street, Boston. It is now burned down.

30 *Q.* Please describe the arrangement in said Thorndike Building, as you saw it in 1852 or 1853?

A. There were three closets and one stack of pipe. When the upper closet was used foul air was forced through the lower closet. An air pipe from the lower closet was run up from the outer side of the trap as before, and connected with the continuation of the main stack through the roof, or run out separately, I disremember which.

31 *Q.* Did you remove the difficulty?

A. Yes.

32 *Q.* Was there any secrecy about the use of these systems of plumbing, or the ventilating air pipes for the traps, which you have described?

A. Not that I am aware of.

JAS. A. TUCKER.

Sworn to before me this 6th day of June, 1881.

JOSEPH GUTMAN, Jr.,
Examiner.

Adjourned to June 7, 1881, at 10 A.M.

NEW YORK, June 7, 1881—10 A.M.

Present—C. WYLLYS BETTS, ESQ., Counsel for defendant.

ISAAC RILEY, a witness of lawful age, produced on the part of the defendant, having been by me first duly cautioned and sworn to testify the truth, the whole truth, and nothing but the truth in the matter of controversy herein, and being examined by Mr. Betts, deposes and says as follows:

1 *Q.* What is your name, age, residence and occupation?

A. My name is Isaac Riley; I am 46 years old; I reside in Boston, Mass.; I am a plumber.

2 *Q.* How long has your occupation been that of a plumber, and to what extent have you been acquainted with systems of house drainage?

A. I was apprenticed to this business in 1847. I have been in business since 1867. My experience has been extensive in drainage and ventilating.

3 *Q.* What experience have you had in ventilating, and when did it commence?

A. It commenced about 1872, in what I would call scientific plumbing. For twenty years I had ventilated traps in soil pipes singly, but did not combine them together in one system till about 1872, at which time I combined two traps separately with one ventilation pipe.

4 *Q.* Please state what work you have done in combining two or more traps in a system of ventilation, and for whom the work was done and when?

A. The first work I did in combining two traps was commenced June 10, 1872, and finished June 18, 1872, in the house of H. W. Suter, 71 Newbury street, Boston, Mass. The date I find from our ledger. There were two traps on separate stories; they both connected with one soil pipe. For ventilation I put in a lead pipe three-fourths of an inch in diameter, running parallel with the said pipe, and running up through the roof and open to the air there. The traps used were D traps, and from the top of each a three-fourths inch pipe lead to and opened into the ventilation pipe.

5 *Q.* What was the purpose of this system of ventilation?

A. At that time the only object I had was letting the gas escape, because I found that the gas corroded the lead.

6 *Q.* What was the next case in which you connected traps with ventilating pipes?

A. Mrs. T. B. Curtis, No. 45 Mount Vernon street, Boston. That job was commenced June 28, 1873, and finished July 14, 1873. There were two traps on separate stories leading into the same soil pipe; at the top of each trap an inch and a half lead pipe led upward to a ventilation pipe, an inch and a half in diameter, this ran up paralled to the soil pipe to the roof open to the air.

7 *Q.* Describe the next work that you did in ventilating traps?

A. W. P. Mason, No. 75 Beacon street, Boston. There were three traps there; D-traps—on separate stories—water closet traps. The work was commenced August 18, 1876, and completed October 25, 1876. The soil pipe was four inches which was reduced to two inches before it got to the roof, and the ventilation of the traps was one and a half inches. The arrangement was similar to the others, the ventilation pipe ran parallel to the soil pipe up

Digitized by Google

through the roof to the air, separate branches an inch and a half in diameter went from each trap to the ventilation pipe.

8 *Q.* Describe any other work you did in ventilating traps?

A. W. S. Dexter's house, No. 24 Mount Vernon street, Boston. That was commenced June 19, 1876, and completed August 29, 1876. The soil pipe was four inches full size through to the roof. There were four water closet traps on four separate stories in the house. Two of these traps opened into the upright soil pipe, and the other two—on the basement and first floor—emptied into the cellar drain into which the soil pipe led.

The basement trap was an S-trap; the other three were D-traps.

Parallel to the soil pipe there was a ventilation pipe, separate from it. Into this, from the top of each of the four traps, were connections of lead pipe; an inch and a quarter in the basement, inch and a half on the first, inch and a half on the third and fourth.

I produce a drawing which shows the work done by me in this house of Mr. Dexter's in 1876, except that the two lower traps are there represented as emptying into the soil pipe instead of into the cellar drain. In all other respects it is correct. The three upper D-traps are represented by the letter A, the S-trap in the basement by the letter B. The ventilating pipe and soil pipe are marked by name. The ventilating pipe which led from the top of the S-trap in the basement ran up, with a diameter of 1¼ inches, to about the point marked in the drawing 1¼—namely, to a point just below the point where the ventilating pipe of the lowest D-trap entered the main ventilating pipe. From that point the ventilating pipe was enlarged to 1½ inches up to the point marked 1½ on the drawing. It was there enlarged to two inches and so continued up to the part marked 2 in the drawing, which runs just underneath the roof. The remainder extending through the roof was 3-inch pipe.

The D-traps used in all the foregoing instances had an air space above the water line, and it was from the top of this air space that the ventilating pipe in each case led to the main ventilating pipe.

The drawing referred to by the witness is offered in evidence and marked Defendant's Exhibit Riley No. 1.

9 *Q.* What was the result effected by the system of ventilation described in your last answer?

A. The results were that there was no suppressed gas remaining in the drain or soil pipes, and no syphonic action possible with that ventilation.

10 *Q.* Were these ventilating pipes, which you have described as placed by you in the houses of Mr. Suter, Mrs. Curtis, Mr. Mason and Mr. Dexter, in any sense experimental?

A. No, sir; not experimental at all. I knew from experience that the connection of these pipes would fully ventilate the traps, and this was the chief reason why the connection was made, because a D-trap has rarely been known to syphon.

11 *Q.* Was there any secrecy in the work which you have described as done by you and your workmen upon these four houses?

A. None whatever; it was done in the most public manner that it could be done. There were masons and carpenters and painters about continually while the work was being done in the Dexter house, as general repairs were then in progress.

12 *Q.* Has the work that you have described in these four houses remained the same from the time you put it in till the present?

A. Yes, sir; except that in the Suter house a year or two afterwards I put in an inch and a half pipe in place of the three-quarter inch pipe. The others remained the same. I am now making some repairs in the Dexter house, and within the past week I have seen the work I did in 1876 unchanged.

13 *Q.* Has the operation of the system of ventilation of traps which you have placed in the four houses above described, been successful or unsuccessful?

A. Successful; the ventilating pipes carried off the sewage from the sewer and soil pipe, and prevented the corrosion of the pipes, and prevented the gas from escaping into the house; and the syphonic action.

In some cases I have also put in an inlet for fresh air at the top of the running trap between the lower and the main house drain; through the inlet the air passed in through the drain and up through all the pipes—soil pipes and ventilating pipes—to the roof. I put the fresh air inlet in the house of Mr. Suter, I think, in July, 1877.

14 *Q.* Are you familiar with the Letters Patent granted to J. McCloskey for improvement in sewer pipe connections, dated August 26, 1879, No. 218,891, and if so please compare the same with the apparatus you placed in the four houses as above detailed, and state whether there is any substantial similarity or difference between them in construction and mode of operation?

A. I am familiar with the patent, it has always been a puzzle to me what McCloskey could gain from his open air inlet at the base of his ventilation pipe, rather than having the pipe open into the soil pipe below; for his system admits no fresh air to the soil pipe but only to the ventilating pipe.

In all respects the apparatus described in the patent is substantially the same as that put by me into these four houses.

ISAAC RILEY.

Sworn to before me,

JOSEPH GUTMAN,
Examiner.

The following deposition of Mr. George Milne, of San Francisco, was also submitted:

OFFICE OF EDWARD HEATON,
Solicitor for Defendant,
Room 1, 49 Nassau St.,
NEW YORK, April 6, 1881.

Met pursuant to adjournment.

Present—EDWARD HEATON and FREDERICK H. BETTS, of counsel for defendant.

GEORGE MILNE, a witness on behalf of defendant, being produced, and duly sworn, testifies as follows:

1 *Q.* What is your name, residence and occupation?

A. George Milne; San Francisco; plumber.

2 *Q.* About how old are you?

A. Forty-five years of age.

3 *Q.* How long have you been engaged in the plumbing business?

A. Since 1852.

4 *Q.* Are you acquainted with plumbing in all its branches?

A. Yes, sir.

5 *Q.* Where, and how did you learn the business of plumbing?

A. Served five years in New York City with William Rhodes, a plumber of this city. His place of business was 827 Broadway. I worked here after serving my time, about three years, I should judge. From here went to San Francisco. Have been practicing my business there ever since.

6 *Q.* What has been your business experience and connection in San Francisco in this business?

A. I have plumbed the largest buildings that have been built there, such as the Palace Hotel; the residence of William C. Ralston; residence of Governor Stanford; residence of Charles Crocker, and others.

7 *Q.* How has your business compared with other plumbers there?

A. For ten years I consider that I have done a larger business in plumbing than any other plumber in San Francisco, of public and private houses.

8 *Q.* Are you acquainted with either the plaintiff or defendant in this suit?

A. No, sir.

9 *Q.* Have you seen the Complainant's Patent No. 218,891, Complainant's Exhibit No. 1? and have you examined the drawing and specifications therein?

A. I have.

10 *Q.* Do you understand thoroughly the invention claimed therein, as an invention for ventilating sewer pipe connections, etc.?

A. I do.

11 *Q.* Have you examined the model now shown you, Complainant's Exhibit No. 2, and do you understand the method of ventilating the traps, and the connections, and the waste and soil pipe connections shown on that model?

A. I have examined that model, Complainant's ExhibitNo. 2, and I understand the method of ventilation shown therein.

12 *Q.* Please state to the Court whether you have ever seen the method of ventilating sewer pipe connections, etc., in use and on sale, previous to July, 1877.

A. I have.

13 *Q.* Please state whether in the Palace Hotel in San Francisco, in which you state you placed the plumbing, what, if any, system of ventilating the soil or discharge pipe was used by you.

A. We ran a main soil pipe up; entered the closets into that, and from the trap of each water closet ran a separate pipe up to the roof, and from each trap connected with that ventilating pipe.

14 *Q.* Have you here a drawing showing how the water closets were connected with the soil pipe in said Palace Hotel in San Francisco, and how the ventilating pipes from the traps were arranged in said hotel?

A. Yes, sir. That is it.

Drawing offered in evidence, and marked "Defendant's Exhibit, Drawing Palace Hotel."

15 *Q.* What was the size of the soil pipe used by you in the Palace Hotel?

A. It was ten inches below, gradually tapering to four inches at the top.

16 *Q.* Into what did the soil pipe discharge below?

A. It discharged right into this 10-inch pipe, and then ran along in the cellar and into the sewer. All iron soil pipe inside the building ran right out into the sewer.

Digitized by Google

17 *Q.* To what did the soil pipe open at the upper end?

A. At the roof, four inches.

18 *Q.* Did it open to the open air?

A. Yes, sir; it ran the water off the roof. It is a rain water leader as well as a soil pipe.

19 *Q.* How many water closets were there in said hotel arranged in connection with the same vertical soil pipe?

A. Six.

20 *Q.* Where did the ventilating pipe open at the upper end?

A. Up through the roof.

21 *Q.* What was the size of the ventilating pipe?

A. An inch and a quarter at the bottom and an inch at the top, that is, as near as I can recollect.

22 *Q.* When you have given the dimensions of pipes, do you mean the interior diameter?

A. Yes.

23 *Q.* How many vertical soil pipes were there in that hotel?

A. As near as I can recollect, about 38 or 40. I cannot swear positively.

24 *Q.* Were there water closets connected with each vertical soil pipe?

A. Yes.

25 *Q.* Were all the water closets arranged with ventilating pipes?

A. Not those in the cellar. All those above the first floor were.

26 *Q.* You say that you put in the plumbing in the Palace Hotel. When was it that you put this plumbing in?

A. About seven or eight years ago, as near as I can recollect.

27 *Q.* What year was it?

A. It was between 1874 and 1876; that is as near as I can come to it.

28 *Q.* What do you mean by "between 1874 and 1876?"

A. This work was in progress in this hotel.

29 *Q.* How early can you state that this plumbing work was finished in the hotel?

A. As near as I can recollect, it was finished some time in 1875. I can't say positively about that.

30 *Q.* How do you know it was not 1876?

A. Because I came here early in 1876, and the hotel, I know, was finished a long time before I came.

31 *Q.* How early in 1876 did you come here from San Francisco?

A. In April.

32 *Q.* Who did this plumbing work on the Palace Hotel?

A. Bush & Milne.

33 *Q.* Please give the full names of the partners composing the firm of Bush & Milne?

A. David Bush and George Milne?

34 *Q.* Where does David Bush now reside?

A. In Post St., San Francisco.

35 *Q.* Did said David Bush and yourself do all the plumbing work in the Palace Hotel that you have described?

A. Yes, sir.

36 *Q.* How long was said system of plumbing, including the management of soil and ventilating pipes and connections illustrated in Defendant's Exhibit Drawing Palace Hotel, used in such hotel?

A. It has been in use ever since it was built.

37 *Q.* How large a hotel is the Palace Hotel?

A. It contains about 1,200 rooms, as near as I can recollect.

38 *Q.* Did your said firm of Bush & Milne introduce the said system illustrated in the drawing Defendant's Exhibit Drawing Palace Hotel, into any other buildings in San Francisco, and if so, when and where?

A. Yes; in William C. Ralston's residence, previous to putting into the Palace Hotel; Gov. Stanford's residence, during the progress of the Palace Hotel; Charles Crocker's during the progress of the Palace Hotel; since that, in Cornelius Sullivan's house in San Francisco, and various other places.

39 *Q.* Do you know whether said system and arrangement of plumbing, as introduced by you into the residences of Mr. Ralston, Gov. Stanford, and Mr. Crocker, have or have not continued in use since the same was put in by your firm?

A. They have been continued in use.

40 *Q.* Do you know whether or not the same are still in use?

A. Yes, sir, they are.

41 *Q.* Did and does the arrangement of plumbing, including the soil pipe, ventilating pipe, and connections from the ventilating pipe to the water closet traps, differ at all in the residences of Mr. Ralston, Gov. Stanford and Mr. Crocker from the arrangement illustrated on the drawing, Defendant's Exhibit Drawing Palace Hotel?

A. The system is the same.

42 *Q.* What was the object and use of the pipes connecting the trap with the ventilating pipes, shown in the drawing Defendant's Exhibit Drawing Palace Hotel, and as introduced by your said firm?

A. To prevent syphonage of traps.

43 *Q.* Explain what you mean by "preventing syphonage of traps."

A. The object is that a column of water rushing down a pipe creates a vacuum and draws the water out of the trap, unless each one has a ventilating pipe, consequently leaves the trap unsealed, and sewer gas rushes into the house.

44 *Q.* How does the use of the connecting pipes from the traps to the ventilating pipe prevent this syphonage?

A. When the water falls down the soil pipe it would, if not for these pipes and their connection with the ventilating pipe, draw the water from the trap immediately after the water falling had passed the mouth of the trap into the soil pipe. By means of these pipes it is enabled to draw air from the ventilating pipe before it draws water from the seal of the trap.

45 *Q.* Are you about to leave the State and Southern District of New York?

A. Yes, sir.

46 *Q.* Where are you going to?

A. San Francisco.

47 *Q.* How soon do you expect to go?

A. In a week, more or less.

(Signed) GEO. MILNE.

Subscribed and sworn to before me this 6th day of April, 1881.

R. T. VAN BOSKERCK,
Notary Public.

There were also submitted in evidence for the defendant, "The Ventilation of Buildings," by W. F. Butler, 1873, D. Van Nostrand & Co., showing a diagram of the proper ventilation of a trap; a patent reissue, Nov. 30, 1875, to J. H. Morrell, for water trap supplies and connections; a drawing illustrative of house plumbing, from THE SANITARY ENGINEER of January, 1878; drawings illustrative of trap ventilation, from Weale's "Plumbing," London, 1876, and S. S. Hellyer's "Plumbing and Sanitary Houses," Baldwin Latham's "Sanitary Engineering," 1873, the *Manufacturer and Builder*, December, 1873, plan of working model of trap ventilation in the rooms of the Health Department of New York City; and a drawing from the Massachusetts State Board of Health report for 1876, showing the proper method for ventilating traps; and a *fac simile* of a bill of Messrs. Hawthorn & Tucker for plumbing in houses built by Mr. Edward S. Philbrick.

For the plaintiff, a model showing system of plumbing in the house of defendant, Mr. James H. Young.

The records of the case also include the testimony of Mr. Thomas J. Nealis, Sanitary Engineer to the New York Board of Health, and Mr. Henry McGuckin, plumber, of New York.

NOTES.

The public schools of Milford, Ohio, have been closed on account of the prevalence of scarlet fever.

The Board of Fire Escapes of Philadelphia has taken steps to compel the Board of Education to erect fire escapes on all the public schools.

Mr. Thomas J. Whitman, Chief Engineer of the St. Louis Water Works, is on a tour of inspection throughout the eastern cities.

Dr. Joseph D. Bryant, Professor of Anatomy in Bellevue Hospital Medical College, has been appointed by Governor Cleveland Surgeon General on his staff.

Schaghticoke village in this State has suffered severely from malaria, said to be caused by stagnant water created by the embankment of the Boston, Hoosac Tunnel, and Western Railroad, obstructing the natural flow of a creek. Governor Cornell several months since issued a proclamation ordering the removal of the embankment, and on the 5th inst. an agreement was held between the people of Schaghticoke and the railroad by which the latter agreed to at once remedy the nuisance.

The Board of Health in New Britain, Ct., has asked the city council for power to stop the attendance at the schools of such children as are known to have been exposed to the scarlet fever.

At Hyde Park, Ill., last week the water collector and his deputies shut the water off from a number of houses which were delinquent in the water rates.

The stove in the saloon of Zanoni and Bacciocco, on West Seventh street, exploded yesterday morning. It appears that the pipe having become choked up, there was no way for the smoke and gas to escape, and the explosion followed. The pipe was forced from its fastenings, and a large drum through which it passed was thrown across the room, and in its course came near demolishing the billiard table.—*Cincinnati Journal, Jan. 11.*

The Highway Commissioners of Philadelphia have under consideration an ordinance authorizing the opening of the streets for the purpose of laying steam heating mains and branches, after the system of the New York Steam Company.

Under date of Dec. 29, the Mayor of El Paso, Texas, telegraphs that there are only twenty cases of small-pox in the town at present, that the city is full of strangers and business is excellent.

Small-pox seems to be rather increasing in Baltimore, and some very sensational reports are being sent to the press of other cities as to its prevalence—as, for instance, that there are now over 1,000 cases in the city, etc. There seems to be a good deal of dissatisfaction among the medical profession of Baltimore with the present Health Commissioner, whose term of office, thus far, has certainly not been a happy one.

The Italian Benevolent Society of this city have given an order for preparing plans for a hospital, to be named in honor of Garibaldi, to Mr. W. H. Woods.

According to the Philadelphia *Enquirer* of Dec. 25, the Obstetrical Staff of the Philadelphia Almshouse have presented a communication to the guardians, setting forth that the mortality from puerperal fever in the hospital during the last twelve years had been from three to four per cent., and attributing this high rate to imperfect ventilation. It is stated that "a microscopical examination of the air, both in the cellar and the wards, had revealed the germs of the disease." It is to be hoped for the credit of the Staff that this quotation is incorrect—for a man who would claim that he could distinguish by the microscope the germs of puerperal fever from other germs in the air is——well, never mind what he is.

AN UNTAMED PUMP ON THE RAMPAGE.

A man erected some kind of a new-fangled pumping apparatus for a rancher at Paradise valley. The pumping machine was to be driven by wind. The other day when a ten-knot breeze was blowing, the inventor "turned her loose." In about half an hour the machine flooded the cattle corral with water, and floated away the butt end of a hay-stack. The ranchman yelled to his machinist: "Stop her! stop her!" but it happened that provision for stopping was what the inventor had not thought of. Had it not been that the well was soon pumped dry, the whole ranch would probably have been washed away. Even after the well was dry, the machine threw mud and gravel so wickedly that to approach it was unsafe.—*Virginia City Enterprise.*

Philadelphia derives an annual revenue of $12,000 from telegraph, telephone, and electric light companies, for the use of its overhead and underground wires. Each company makes a return annually of the number of poles, etc., and a payment of $5 per annum for each mile of wire used for telegraph or telephone purposes, and $15 per mile per annum for electric lighting purposes is required. There are at present about 10,000 miles of wire in the city.

Novelties.

Under this heading we propose to supplement our section on patents by descriptions and illustrations of new appliances put on the market. The selection will be made without reference to the wishes of agents or patentees, being governed solely by considerations of novelty, ingenuity and probable interest to readers, and especially the fact that they have not been elsewhere described. As a rule we shall make no comments, and IT IS TO BE DISTINCTLY UNDERSTOOD THAT A NOTICE DOES NOT IMPLY APPROVAL. *No charge will be made for these notices, and any offer of pay for their insertion will insure their omission. We shall be glad to have our attention called to novelties suitable for this section.*

CHURCH'S WASTE-WATER INDICATOR.

The following is a description of a "waste-water indicator," invented by Benjamin S. Church, C.E., of this city, and resident engineer of the Croton aqueduct.

The device consists of a pressure gauge, with arrangements for attaching it to the pipe through which water is suspected of leaking. Its most extensive application is designed to be to service pipes from street mains to houses. For this purpose, a special stop cock is placed on the service pipe under the sidewalk instead of the ordinary kind, and from it a pipe, or hollow stem, instead of a solid rod, runs up to the stop cock box. The shank

WATER-WASTE INDICATOR

INVENTED BY B.S.CHURCH, M.S.C.E. N.Y.

of the key, also, is hollow, and has a pressure gauge attached at the top. By means of a coupling, turned by a wheel at its top (shown just below the handles of the key on either side of the gauge), an air tight connection is made between the stem and the key. When the cock is closed (by turning the cross-arms, and with them the gauge, which is fastened to them), a small "port" in the stop cock plug establishes a connection between the street main and the gauge; the air in the stem is compressed, and the hand on the gauge indicates the hydrostatic pressure in the main. By turning the plug to another position, a second "port" is opened, allowing the water to flow through, if there be any escape from the pipes in the house. If that be the case, the gauge will indicate a diminished pressure, depending on the amount of discharge. The plug can also be turned to a third position, leaving it open to the house and closed against the street. By this means the approximate height of the leak (if such is found) is ascertained. The exact position of the ports is indicated on a scale, with vernier, which slides up and down the coupling, to be clamped at the level of the sidewalk for convenience in making reference marks thereon. The gauge is said to indicate a flow of five gallons an hour, and "reveal the least leakage, even to the size of a pin-hole." The apparatus may also be applied to street mains to detect leaks in them.

It has been tested to a limited extent during the past year by the Department of Public Works of this city, but the results of the tests have not yet been made public.

Construction Notes.

CHICAGO.—The aldermen, influenced by the Milwaukie fire, propose directing the Board of Education to build additional stairways to the second and third stories of all school buildings. Keys are also being newly fitted to theatre exits.

Last year, according to the report of the Building Permit Clerk of Chicago, there were 5,824 taps inserted, of which 1,563 were made for contractors for street improvements. The number of permits issued for making connections was 577; for tapping, 4,649; for miscellaneous connections, 1,313; making a total of 6,539 permits issued. One hundred and eighty-one licenses were issued to plumbers, and 347 leaks in water pipe were repaired.

IOWA CITY.—About two and a half miles of water mains have been laid for the water works, Holly system.

PHILADELPHIA.—The business men's organization have reported a plan for reform in street cleaning and repairing which provides for dividing the city into 50 districts, and gives the Board of Public Works absolute power to let and annul the contract in each. On complaint of seven property owners payment to a contractor may be stopped. The cost of cleaning and repairing the streets is to be assessed per front foot on the property owners.

CINCINNATI.—A resolution has been introduced into the Board of Public Works requesting the City Engineer and the Superintendent of Water Works to report on the possibility of removing the pumping works to Markley Farm, on the ground that the removal would allow a cheaper system of trunk sewers to be devised than that which is now provided for in the bill now pending in the State Legislature.

OHIO.—It is proposed to enact a general law providing for the construction of "trunk sewers" in cities of the first grade of the first class, by a tax of one mill on the dollar for five years. The fund thus provided is to be kept separate from other city funds and to be applied to the payment of the cost of "trunk sewers" over the amount authorized to be assessed on property benefited by branch and lateral sewers. This is a good idea and might well be adopted in other States also.

NEW ORLEANS.—A resolution repealing the ordinance by which the mayor was authorized to enter into a contract with the New Orleans Drainage and Sewerage Company to establish a system of sewerage was introduced in the City Council the 9th inst. and laid over.

CHICAGO.—The annual report of the Building Department of Chicago shows that 8,113 new buildings were erected in that city last year, at a total cost of $15,842,800.

ATHENS, GA.—The Savannah *News* says that "the question of the Athens water works is exciting interest in that city. The preliminaries have been arranged, and the water works will doubtless be in operation in a short time. Some of the property owners threatened to enjoin the city, but better counsels prevailed and this matter has been settled."

ANSONIA, CT.—The water company have purchased the Judge Quilinan property, on which is situated a large dam, for an additional supply of water for the borough. The dam will be raised five feet higher and will store 27,000,000 gallons.

HAMILTON, ONT. has now 59.82 miles of main pipe within the city limits, with 473 fire hydrants, 220 main stop valves and 8,150 house services. The pumping house, reservoir and city are connected by an 18-inch and a 20-inch main.

PHILADELPHIA, PA.—Synopsis of bids for iron stairways for post office and custom house opened Jan. 3.

C. Hitzeroth	$2,525 00
Bartlett, Haywood & Co	4,350 00
Snead & Co	4,473 00
R. Tippetts & Son	4,900 00
Phœnix Iron Co., Trenton	5,197 00
Haugh, Ketcham & Co	5,904 94
W. Bugbee Smith	6,250 00
S. J. Creswell	7,200 00
Cheney & Hewlett	8,169 00

Mr. C. Hitzeroth has been awarded the contract.

NEW YORK CITY.—The following bids were opened by the Commissioner of Street Cleaning, on the 15th inst.:

Name of Bidder.	Price per cu. yd. for Removing			
	Sweepings.	Ashes.	Garbage.	All Refuse Together.
John Fox				14½ cts.
John A. Bouker	14½ cts.	17½ cts.	23½ cts.	19½

Higinbothem Bros. offered to furnish the whole lot for $1,645.

SYRACUSE, N. Y.—The Hilton Bridge Company, of Albany, has been awarded contract for two lift bridges over the Erie Canal, for New York, West Shore and Buffalo Railroad. The two bridges will cost over $40,000, including the hoisting machinery, which is to be furnished by the Delamater Iron Works, of New York city.

EAST ST. LOUIS, ILL.—The East St. Louis and Belleville Water Company has been incorporated with a capital of $100,000.

DANVILLE, ILL.—Proposals will be received by K. P. Corbyn until Jan. 23, at the office of the Water Works Company for the machinery, buildings, stand pipes, hydrants, etc., for the water works.

YONKERS, N. Y.—Proposals should be sent to the Water Commissioners until Feb. 1, for a high pressure steam-pumping engine and boiler, capable of raising 1,000,000 gallons in 24 hours to a height of 100 feet.

THE SEWERAGE OF NORFOLK.

NORFOLK, VA., *Jan.* 9, 1883.

To the Editor of THE SANITARY ENGINEER:

Work was commenced on the sewer system here in the latter part of February, 1882, and has been since prosecuted, with some interruptions, not occasioned by the character of the work itself. We commenced reducing force about the 1st of June, and entirely suspended work on the 28th of July. We did not resume until about Nov. 1, thus losing the dryest, and for that reason the best part of the year. The system has been constructed substantially in accordance with the plans devised by Col. George E. Waring, a description of which was published in THE SANITARY ENGINEER about two years since. It is intended to provide for sewage and sub-soil water only. It consists of a system of pipes, beginning with 6-inch, draining a length of not more than 1,500 feet, and gradually increasing to 18-inch, draining 35,000 feet. The sewage will be discharged into a well, from which it is to be pumped into Elizabeth River. Two 3-million gallons Davidson pumps have been provided for this purpose. The city is generally underlaid with a thin bed of sandy clay, in many places not three feet thick; below that, fine sand fully charged with water. It was found necessary to

Digitized by Google

close shut nearly all of the trenches and to batten some of the joints between the planks in the deep ones, to keep out the sand. A part of the city is built upon made land, and trenches in this section sometimes encountered mud of such consistency as to flow in under the sheathing and rise up in the trench about as fast as taken out. In some places it was found necessary to drive 3-inch sheeting six or seven feet below grade, to prevent this inflow of mud.

We have about eight miles of pipe laid, and one of the mains will be completed and connected with the pump well in a few days. The house drains are of 4-inch pipe, and are laid to the curb stone by the city. The pump well is 23 feet deep, 12 feet in diameter, and is curbed with an 18-inch brick wall, which was sunk to position in the mud of the accretions on a cast iron shoe. For the removal of the sub-soil water from the well and the deeper trenches, the pulsometer has been used, and found quite satisfactory. Carson's excavating machine has been used in a portion of the deeper trenches with decided advantage. For driving sheeting we have in some cases used advantageously a hammer, which slides upon an iron bar passing through the middle of it, patented by D. Knowles, of this place. In many of the trenches the saturated sand was so quick that it was found necessary to lay the pipe on platforms of boards, which were placed a little below grade so as to make room for the sockets. Oyster shells, as the cheapest suitable material obtainable for that purpose, were used to fill in the platforms to the exact grade. Since it was not possible to keep the trenches free from water, it was apprehended that joints made of even the quickest setting cement would be dissolved before the cement could set. After the work was commenced it was determined to use the Stanford joint, and a subsequent examination of the pipes while laying house drains, has shown those laid with this joint to be in rather better condition than those laid with cement. For the information of your readers not already familiar with it, this joint may be described as composed of sulphur, coal tar, and sand, mixed in such proportions as to produce the requisite degree of hardness when cold, moulded upon the spigots and in the sockets, by means of male and female cast iron moulds, turned to fit accurately. A mixture of hot grease and resin is applied to the joint just before it is laid, the spigot is then inserted in the socket and pushed home by means of a spade used as a lever. This joint is made of sections of a sphere which permits some movement of the pipe without impairing the joint. The lateral sewers here have been usually laid from five to six feet deep, the mains generally 12 to 18 feet. Yours,

J. H. HUMPHREYS.

MAYOR LOW ON BROOKLYN MATTERS.

The annual message of Mayor Low, of Brooklyn, expresses the writer's belief that the system of responsibility to a common head has caused increased efficiency and economy, as it certainly has produced harmonious administration in the government of that city.

The permanent debt of the city has been increased $408,000 during the year 1882, and the temporary debt decreased $440,000.

The mode of paying for lands taken by the city under the right of eminent domain, is severely criticised. It has been customary to pay damages only as fast as assessments for benefit were collected.

The mayor says, very fairly:

"The Legislature will be asked for authority to issue bonds in amounts sufficient to pay all such outstanding awards. In my judgment, the city ought never to have been allowed to take a foot of land from any one until the damages allowed therefore had been paid in cash. A great city has no right to ask fair dealing of its citizens and then in its turn to deal with them unfairly."

"He who asks equity must do equity."

The Brooklyn Bridge management gets a pretty hard slap. Mr. Low says:

"The annual interest charged upon our bridge bonds at this time is $660,550. Of this sum $210,000 have been raised annually in the tax levy. The balance of interest has been paid with the proceeds of bonds. Since the beginning of the work bonds have been issued to pay interest to the extent of $1,809,625.

"As a means of concealing from the citizens what the bridge would cost to carry, such financiering has much to commend it. As a method of constructing a great public work it cannot be so easily justified."

The condition of the water supply is briefly recited. New engines, more pipe and the procuring of an additional supply by tube wells have been provided for. The Chief Engineer, Mr. Robert Van Buren, is highly commended and attention is called to the ridiculously small salary he receives.

The several suggestions as to changes in municipal methods show careful study and much thought. It is, of course, impossible to agree with all of them, but they are all worthy of careful consideration by the citizens of Brooklyn.

The laying of a tax on private corporations occupying public streets for the purpose of accommodating the public is advocated. This is one of those matters in which a great deal is to be said on both sides of the question. Mr. Low thinks that a percentage of the gross receipts should be paid into the City Treasury. Whether it is better to do this, or to insist on moderate fares and good accommodation is not certain. Thorough inspection and policing seems more necessary to many persons than the extraction of the forced money contribution from the companies.

Mr. Low's ideas regarding the public service will seem outrageous to most of our "ruling class," but nevertheless they are sound, and there could be no good and economical government until they are put in practice. The mayor puts the case plainly and his words ought to be carefully weighed by the tax payers of other cities as well as Brooklyn. He says:

"I repeat my belief that it would be greatly in the interest of the city to have some system adopted for entrance into the subordinate civil service of the city which should reduce personal patronage to a minimum. Such a system, if practically successful, would leave heads of departments much more free than now to attend to the business of the city. I think it would even relieve the members of your honorable Board from occasional embarrassment. It would certainly make the city the real master of its own clerical force. The people do not recognize to what an extent, in the absence of such a system, outside politicians usually control, and make and unmake the clerical force of the city."

Reviews of Books.

AMERICAN FOUNDRY PRACTICE. A Practical Treatise upon the Managagement of Cupolas and the Melting of Iron. By Thomas D. West. New York: John Wiley & Sons.

The book gives the views of a practical moulder and manager of foundries on the various questions arising in the daily experience in a foundry.

The articles were, to some extent, originally printed in the *American Machinist.* The leading points touched on are, The Moulder and the Foundry; Green Sand Moulding; Loam and Dry Sand Moulding; Manipulation of Iron Castings; Notes and Recipés. Pattern makers and moulders in considering the best method of making difficult castings will, we believe, find suggestions in it which will be of service to them. We can commend the book as the best one we know of in its special line.

The publishers of the *Sanitary Record and London Medical Record* have issued a Diary for 1883 which will prove a convenience to professional men. There are some sixty pages of miscellaneous data useful to medical men, and a blotting leaf between each page of the diary. The large number of advertisements suggests that the enterprise has not been without profit to its projectors.

The *American Machinist* of Jan. 20 prints several pages of letters from representative machinery manufacturers in all sections of the country, giving their views of trade present and prospective. These responses were received in reply to an inquiry sent out by the *Machinist.* The testimony all seemed to be expressed in the following suggestive statement of one firm: "Being decidedly of the opinion that this country is not yet finished we have no doubt that somebody will have something to do." We further notice that our cotemporary says the "number of subscriptions daily received is greater than at any other period since its establishment." It is gratifying indeed thus to see that honest and able management in special journalism has been so substantially rewarded as in the case of the *American Machinist.*

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to December 1, 1882.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending January 6, in 30 U. S. Cities containing an aggregate population of 6,307,769, there died 2,639 persons, which is equivalent to an annual death rate of 21.3 per 1,000, being precisely the same as for the preceding week. In the North Atlantic Cities the rate was 20.8; in the Eastern Cities 22.9; in the Lake Cities 17.7; in the River Cities 19.7; and in Southern Cities, for the whites 20.3 and for the colored 31.7 per 1,000.

The proportion of deaths under five years was 30.7 per cent., which is decidedly below the average; it is, as usual, above the average in the Lake Cities. Small-pox and diphtheria show a slight increase, and the same is the case as regards measles and scarlet fever. It will be seen that the death rates are, as usual, less than those in foreign cities.

OGDENSBURG, N. Y.—Health Officer, Wm. O. Bridges, reports the extensive prevalence of mumps.

BOSTON, MASS.—C. E. Davis, Jr., reports 57 cases of diphtheria, 33 of scarlet fever and 11 of typhoid fever.

WILMINGTON, DEL.—Dr. E. B. Frazer, Registrar, reports two cases of small-pox.

CINCINNATI, OHIO.—The report of Dr. D. D. Bramble shows the city to be free from small-pox.

LOUISVILLE, KY.—Health Officer Montgomery reports that nine cases of small-pox were recorded during the week. With one exception they were removed to hospital for treatment.

ATLANTA, GA.—Four cases of small-pox are reported during the week.

MILWAUKIE, WIS.—Dr. E. W. Diercks reports 18 new cases of scarlet fever and four of diphtheria.

NEW YORK CITY LUNATIC ASYLUM, BLACKWELL'S ISLAND.—Dr. Franklin reports nine admissions, 15 discharges, 3 deaths, and 1,307 remaining under treatment.

PITTSBURGH, PA.—Dr. Snively reports two cases of small-pox.

DETROIT, MICH.—Dr. O. W. Wight reports 49 cases of scarlet fever, 55 of diphtheria and one of small-pox.

SAN JOSÉ, CAL.—Dr. Breyfogle, in reporting the population at 12,685, that under five years at 1,058, the deaths from all causes at

Digitized by Google

31, and those under five years at 7, remarks that these are the largest mortality figures furnished by San José in the past six years.

SAN FRANCISCO, CAL.—For the week ending Jan. 5, Dr. Hoerch reports 99 deaths from all causes, 23 of which were under five years of age, three were from accident, one from cerebro-spinal meningitis, 19 from consumption, one diarrhœal disease, three diphtheria, two typhoid, 14 pneumonia, one congestion of lungs and six bronchitis.

CAMBRIDGE, MASS.—Dr. Holt's report for the week ending December 30 gives a total of 15 deaths, of which 6 were under five years. Of the causes given in our table, accidents occasioned one death, consumption two, diphtheria two, typhoid fever one and pneumonia one death.

ROCK ISLAND, ILL.—Dr. G. G. Craig reports four deaths in a population of 11,650. No infectious diseases are recorded.

HUDSON CO., N. J.—The report for the week ending December 30 did not arrive in time for tabulation. There were 96 deaths, 47 being under five years of age. Accidents caused five deaths, consumption five, croup four, diphtheria two, typhoid fever two, scarlet fever eight, and acute diseases of the lungs seven.

MICHIGAN.—Reports to the State Board of Health show the prevalence of the following diseases, during the week ending December 30: neuralgia, rheumatism, consumption, bronchitis, intermittent fever, tonsilitis, influenza and pneumonia. Intermittent and scarlet fevers, croup and measles increased in their areas during the week. Small-pox is reported from two places in the State, Richmond, Osceola Co. and Ionia. Three cases of scarlet fever are reported at Marquette, among immigrants just arrived from England. The disease was contracted on the steamer.

NEW ORLEANS, LA.—The report for the week ending Dec. 30 was not received in time for tabulation. Deaths 135; white males 60, females 24; colored males 23, females 28; under five years, white males 11, females five; colored males seven, females six; over 60 years, white 21, colored ten. Annual rate 31.68, for white population 26.98, for colored 44.78. Small-pox caused nine deaths, scarlet and typhoid fevers one each, malarial fevers nine, puerperal fever one, diphtheria four, consumption 17, acute bronchitis four, pneumonia 13, croup one, and accidents seven.

BOSTON, MASS—The Board of Health has recently issued a circular signed by Dr. Duegan, to urge greater care in preventing the spread of typhoid fever. The discharges from the bowels of the typhoid patient are supposed to be the source of the greatest danger and it is directed that "all vessels used for receiving the discharges of the patient should constantly contain some disinfecting fluid." A five per cent. solution of chloride of zinc will be effectual and without odor or stain.

The sick person is to be placed in a room apart, and the case treated as f it were one of contagious disease.

BALTIMORE, MD.—The number of deaths for the week ending June 6, 1883 was 241, giving, according to the registrar's estimate of population an annual mortality rate of 30.64. According to a proper estimate of the population based on the U. S. Census the true mortality is 36.4. This high death rate is due mainly to small-pox, 79 deaths from which were recorded during the week. There were 18 deaths from diphtheria, five from scarlet fever, three from typhoid, one from measles, one from whooping cough; 87 deaths were of children under five years.

ONTARIO, CANADA.—The provincial health bulletins for the weeks ending Dec. 23 and 30, have been received. Bronchitis, neuralgia, anæmia, rheumatism, tonsilitis, and consumption occupy the prominent places in both reports. The zymotic diseases, such as whooping cough, scarlet fever, measles, and diphtheria, which have been limited in their area, are showing a tendency to increase.

CARDENAS, CUBA.—J. H. Washington, Vice Commercial Agent, under date of Jan. 5, reports the city as "distressingly healthy," from the doctor's point of view. No yellow fever or small-pox is reported present.

AUX CAYES, HAITI.—Consular Agent Dutton reports the continuance of small-pox. During the weeks ending Dec. 9 and 16 there were, respectively, four and two deaths from this disease.

HAVANA, CUBA.—Dr. D. M. Burgess reports for the week ending Dec. 30, that the cases of yellow fever which are now occurring are confined to rooms, localities, wharves, and hospitals where the disease prevailed during the summer months. Only three deaths were reported during the week from yellow fever. No deaths from small-pox or typhus fever were recorded.

PERNAMBUCO, BRAZIL.—Consul Henry L. Atherton sends report for the weeks ending Nov. 27 and Dec. 4, showing a death from yellow fever during the latter week, the first which has occurred this season. Small-pox is reported as having caused three deaths during the second, as against 11 deaths during the first week. Consul Atherton transmits the report of the Health Inspector for the quarter ending September 30, showing 1,209 deaths; males, 670; females, 539; of these 113 were caused by small-pox, 159 by consumption, 111 by convulsions, 18 by malarial fevers, 41 by diarrhœa, 13 by dysentery, 30 by bronchitis, 28 by pneumonia, and 14 by erysipelas.

RIO DE JANEIRO, BRAZIL.—Vice Consul General James H. Murray reports 226 deaths for the week ending Dec. 2. Small-pox caused 39 deaths; typhoid fever three, pernicious fever nine, and consumption 34. But for the prevalence of the small-pox the health of the city would be considered excellent.

ENGLAND.—In 28 English towns 4,480 deaths were registered during the week ending the 23d inst. The annual death rate in these towns, which had been equal to 22.3, 23.4 and 26.9 in the three preceding weeks, rose to 27.6. The rates reached 31.3 in Manchester, 32.1 in Preston, 32.2 in Plymouth, 32.9 in Newcastle-upon-Tyne, 36.9 in Huddersfield and 40.1 in Liverpool. The deaths referred to the principal zymotic diseases were 478, showing a decline from the numbers in the two previous weeks; 110 resulted from measles, 100 from scarlet fever 106 from whooping cough, 85 from "fever" (principally enteric), 47 from diarrhœa, 24 from diphtheria, and six from small-pox. The 24 deaths from diphtheria included 12 in London, two in Liverpool and two in Halifax. Small-pox caused four deaths in London and its outer ring of suburban districts, two in Newcastle-upon-Tyne, and one in Wolverhampton. The deaths referred to diseases of the respiratory organs in London, which had increased in the six previous weeks from 330 to 637, were 633 last week, and exceeded the corrected weekly average by 61.

SCOTLAND.—The return of the Registrar-General for the week ending Dec. 23, shows a rate of 30.8 in the eight principal towns. This rate is 6.3 above that of the corresponding week of the previous year. The mortality was lowest in Perth, 17.2 and highest in Glasgow, 37.5 per 1,000. No deaths from small-pox are reported. Glasgow furnished nine of the 11 fatal cases of measles which occurred in the eight towns, 17 of the 23 cases of scarlet fever, 11 of the 17 cases of diphtheria and 28 of the 43 cases of whooping cough.

IRELAND.—Consul A. B. Wood, of Belfast, transmits the return of the Registrar-General for the week ending Dec. 23, a summary of which is embraced in our table given above.

PARIS, FRANCE.—During the week ending Dec. 13 there were 1,094 deaths, males 614, females 480; under five years 282, over 60 years 235. Annual rate 25.38. Consumption caused 212 deaths, typhoid fever 49, scarlet fever three, small-pox seven, measles 16, whooping cough none, diphtheria and croup 43, acute bronchitis 45, pneumonia 75, and violence 37.

During the week ending Dec. 20 there were 1,202 deaths, males 638, females 564; under five years 293; over 60 years 279. Annual rate 27.91. Consumption caused 197 deaths, typhoid fever 84, scarlet fever one, small-pox nine, measles 18, whooping cough five, diphtheria and croup 35, acute bronchitis none, pneumonia 81 and violence 40.

BRUSSELS, BELGIUM.—During the week ending Dec. 16 there were 291 births and 178 deaths in the city and suburbs, corresponding to annual rates of 38.0 and 22.7 per 1,000. Of the decedents 66 were under five years of age Small-pox caused four deaths, scarlet fever none, measles and diphtheria one each, typhoid fever and whooping cough two each, croup three, diarrhœal diseases 17, acute lung diseases 33 and consumption 27.

ST. PETERSBURG, RUSSIA.—Consul General Stanton reports 655 deaths for the week ending Dec. 9; males 370, females 285; under five years 308; over 60 years 83; population 927,467. Small-pox caused 20 deaths. On Dec. 10 there were 795 patients in the fever hospitals, 75 in the small-pox hospital and 1,198 in the venereal wards.

CALCUTTA, BRITISH INDIA.—Consul General Mattson reports 312 deaths during the week ending Nov. 25, which corresponds to an annual rate of 37.5 per 1,000 of population, as compared with a rate of 33.0 during the previous week. Cholera caused 47 of the deaths, fevers 104, bowel complaints 44, tetanus 21, consumption five, pneumonia two, and accidents eight deaths.

The report of the Health Officer for October shows the registration of 739 births and 1,151 deaths. The births exceed the decennial mean by 121 and the deaths by 71. The annual death rate for the month was 31.8. Cholera prevailed sporadically and with rather more than usual severity. It caused 91 deaths against 38 in the preceding month and exceeded the decennial mean by 24. No deaths were registered from small-pox. The increased death rate in October was mainly caused by diarrhœal diseases.

MADRAS, BRITISH INDIA.—Consular Agent L. Strange sends the municipal return for the week ending Dec. 1, showing 338 live births, equal to a rate of 44.2, and 13 still births. There were 312 deaths corresponding to a rate of 40.8; males 158, females 154. Of these 258 were buried and 54 burned. Small pox caused one death, measles two, fevers 76, dysentery 28, and diarrhœa seven. No deaths from cholera were registered.

SHANGHAI, CHINA.—Vice Consul General F. D. Cheshire reports a third case of diphtheria in the foreign population during the week ending Nov. 28.

FOOCHOW, CHINA.—Vice Consul J. P. Cowles reports on Nov. 25 that there are rumors of cholera which are denied by the physicians.

PROPOSED LEGISLATION

ON

SUBJECTS OF INTEREST TO READERS OF THE SANITARY ENGINEER.

NEW YORK—*Senate.*

Date.	Introduced by	Title.
Jan. 10.	TITUS.	To authorize the city of Buffalo to issue bonds for construction of Bird avenue sewer.
Jan. 10.	BAUCUS.	To empower a company to dam the Hudson River at Halfmoon, Saratoga Co.
Jan. 11.	JACOBS.	To amend the law relating to the management of gas companies.

NEW YORK—*Assembly.*

Date.	Introduced by	Title.
Jan. 10.	SHERIDAN.	Providing that no steam boiler shall be exempt from inspection.
Jan. 10.	SHERIDAN.	To extend the sewer located on Third avenue, Brooklyn.
Jan. 10.	VAN ALLEN.	To amend the Act relating to water works companies.
Jan. 10.	CLARKE.	To amend the Act creating a Department of Street Cleaning in New York City.
Jan. 10.	ROESCH.	Relative to the manufacture of cigars in tenement houses.
Jan. 10.	KEYS.	To amend Act in relation to gas light companies.
Jan. 12.	MULHOLLAND.	To regulate the quality and price of illuminating gas.*
Jan 12.	CONSALUS.	To authorize the construction of a dam across the Hudson River at Halfmoon.

NEW JERSEY—*Senate.*

Date.	Introduced by	Title.
Jan. 10.	GRIGGS.	To provide for raising money where Boards of Health of cities of the second class have exhausted their regular appropriations on account of the prevalence of epidemic or contagious diseases.

OHIO—*House of Representatives.*

Date.	Introduced by	Title.
Jan. 10.	METCALF.	To authorize towns and villages of the second class to issue bonds to construct water works.
Jan. 11.	ALEXANDER.	To amend Section 2,125 so as to compel all boards of health in cities to appoint an inspector to report semi-annually on the sanitary condition of school houses.

PENNSYLVANIA—*Senate.*

Date.	Introduced by	Title.
Jan. 10.	ARNHOLT.	To regulate the levying, collecting and disbursing of water rents and taxes of cities of the second class.

PENNSYLVANIA—*House of Representatives.*

Date.	Introduced by	Title.
Jan. 9.	SNODGRASS.	For the better security of life and limb from crude petroleum.
Jan. 9.	HETHERSTALL.	To create additional means of escape in cases of fire from hotels, factories, etc.
Jan. 9.	VAN KIRK.	To secure the health and safety of persons employed in bituminous coal mines.
Jan. 10.	THOMPSON.	To protect the life and health of persons employed in bituminous coal mines.
Jan. 10.	NICHOLSON.	To prevent the obstruction and pollution of navigable streams.
Jan. 10.	STEWART.	To regulate the practice of pharmacy, the sale of drugs, and to prevent the adulteration of food.

FLORIDA—*Senate.*

Date.	Introduced by	Title.
Jan. 8.	POWERS.	To incorporate the Artesian Well Co. of Florida.

FLORIDA—*Assembly.*

Date.	Introduced by	Title.
Jan. 5.	MABRY.	To protect the public health against infectious diseases.

A resolution was introduced by Mr. McElroy, the 10th inst., that the Committee on Railroads be instructed to inquire as to the feasibility of lighting the Fourth avenue tunnel in New York City by electricity.

A death occurred at a Hester street tenement house, last week, from what the Board of Health physicians believe to have been typhus fever. Precautions were taken to prevent the spread of the disease, as requiring a private funeral and removing other patients to hospitals.

The Philadelphia Committee of one hundred has been holding civil service examinations to select a candidate for the reform members of the city council to support for the position of chief of the Water Department in place of Dr. McFadden, who has held the place for some years and reduced the expenses and increased the efficiency of the works. They have agreed to recommend a Mr. John Rowbotham, who has never, so far as we can learn, had anything to do with the management of water works.

* This bill provides that all gas furnished to New York and Brooklyn, used through a burner consuming five cubic feet per hour, shall be of a brilliancy, or illuminating power, of sixteen sperm candles, and at a price not to exceed $1.50 per thousand cubic feet. Penalties are provided for violations.

AN EXPLANATION.

To the Editor of THE SANITARY ENGINEER:

I see by the issue of your paper, under date of January 11, 1883, that you have published a communication from a plumber by the name of Lindsley, that I claimed my patent system to have been indorsed by THE SANITARY ENGINEER, which is not true, but I do claim that my system has been indorsed and recommended by the sanitary engineers. The attempt to induce the councils of Philadelphia to pass an ordinance to control plumbing work, was made by Mr. Lewis O. Howell, Jr., as he had presented to the Board of Health a full copy of the New York Code of Laws, some six months ago; it was then referred to the survey committee of councils. When the survey committee were about to meet, they notified Mr. Lewis O. Howell, Jr., to attend the meeting, at which place he explained the way plumbing work should be done under the said laws, showing properly and improperly constructed systems of house plumbing.

The patent system of cold air ventilation with the patent angle ventilator, was not talked of for adoption; the main object was to induce them to adopt a code of laws similar to the ones adopted by the New York Board of Health.

I had the presumption to think that, as an American citizen, I had a perfect right to try and have an ordinance pass City Council, which I thought would benefit my fellow-man, without asking privilege of so great a personage as Mr. W. E. Lindsley. I have written to Mr. Lindsley to retract his letter to you hoping that you will correct the same in your paper, as I did not claim to have been indorsed by you.

I remain, yours respectfully,

LEWIS O. HOWELL, JR.,

[Our comments were based entirely on the unauthorized use of our name in a newspaper advertisement. Mr. Howell's letter does not meet the issue.]

LECTURE BEFORE THE MASTER PLUMBERS.

The third entertainment in the course of the Master Plumbers of this city, being a lecture on "The Almighty Dollar," by Rev. William Lloyd, occurred at Steinway Hall, on Tuesday evening of last week. The large hall was almost filled by an appreciative audience, which expressed its approbation by frequent bursts of applause. The lecturer said he addressed his hearers not as a minister but as a fellow workman. From childhood he had known what hardship and poverty meant. A glimpse of his own early life when, after toiling hard all day in an English mill, he studied with greater zeal far into the night to educate and lift himself above his fellows, drew the closest attention of his audience. The lecture was a plain, forcible talk on money, its value, use and abuse, interspersed with a few laughable anecdotes which kept his hearers from weariness and in the best of humors.

The next lecture will be on February 6, by James C. Bayles, editor of *Iron Age*; subject: "No. 26 Daydream Avenue."

PLUMBING LAW VIOLATIONS.

Four cases were given to the attorney, but no new cases of a serious nature were reported last week. Minor violations were reported as follows: By Inspectors Eagleson and Hooper two each, and by Inspector Hollick one.

ROYAL BAKING POWDER

ABSOLUTELY PURE.

This powder never varies. A marvel of purity, strength and wholesomeness. More economical than the ordinary kinds, and cannot be sold in competition with the multitude of low test, short weight, alum or phosphate powders.

Sold only in cans, by all Grocers.

ROYAL BAKING POWDER CO.,

106 WALL STREET, NEW YORK.

The publisher of THE SANITARY ENGINEER will esteem it a favor if names of persons likely to be interested in the journal are sent to him, in order that he may send them specimen copies.

Pure Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in barrels and *half barrels*.

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

HAVEMEYERS & ELDER.

DECASTRO & DONNER REFINING CO.

117 WALL STREET,

NEW YORK.

A SOUND POLICY.

PURE SPICES ONLY.

Some manufacturers and dealers allege that it is necessary to give a large weight or bulk for a certain amount of money, hence the admixture of many worthless, if not hurtful, compounds. Now we do not believe in this argument, and while there may be some demand for "a big package for a small amount of money," we rate the intelligence of the American people too high to believe that they prefer to have half a pound of adulterated spice instead of a quarter of a pound of pure spice containing the same strength. As well might the consumer prefer a quart of water mixed with an equal quantity of milk at a higher price for the two quarts of mixture than for the one quart of milk. We therefore put up

PURE SPICES ONLY,

and leave it to others to furnish adulterated spices, if any are required. We some time since dropped from our list the Griswold's O K and I X L brands, retaining the "*Thurber's S. I.*," and "*Massasoit Mills*" brands, the former being an extra grade of the finest, freshest and strongest spices, especially Selected and Imported, hence the brand (S. I.), for the finest trade; while the "*Massasoit*" brand will represent strictly pure goods of good quality. Both of these brands will be put up *full weight*, thus heading off another swindle frequently perpetrated upon the consumer, and to meet the demand which may legitimately exist for a package of spice for a small amount of money, we have concluded to put up, in addition to the larger size, *a two-ounce round tin, with sifting top*, which we guarantee contains more real value than the usual four-ounce tin of adulterated spices, the only condition necessary in the use of pure spices being to use less of them.

We expect that consumers will, and, indeed, they have, sustained us in taking this stand. Reputable dealers prefer to sell only full weight and genuine goods. Competition from the unscrupulous sometimes induces them to keep good, bad, and indifferent. We rely on the intelligence of consumers to encourage them to keep first-class articles. Ask therefore for

Thurber's S. I. Spices.

They are put up in two, four, eight and sixteen-ounce tins. *Always full weight.*

P. O. Box 3037. 140 William St., New York

Copies will be sent, postage paid, on receipt of price.

A Valuable Book of Reference.

THE FIFTH VOLUME OF

THE SANITARY ENGINEER,

OF NEW YORK,

Includes the twenty-six weekly issues from December 1st, 1881, *to May 25th*, 1882.

A complete record of all United States Patents for furtures and appliances used in plumbing, sewerage, gas fitting, gas manufacture, steam and hot water heating, ventilation, and electric lighting, makes it valuable to inventors and manufacturers.

The following are a few of the many articles of permanent interest:

A review of town sewering in England, with opinions on the question of small *versus* large sewers, or the combined *versus* the separate systems, by Robert Rawlinson, C.B, Chief Engineer, Inspector Local Government Board, England.

A report on the Sewerage of Concord, by Edw. S. Philbrick, C.E., instructive to town authorities generally.

Remarks by John S. Billings, Surgeon, U. S. Army, before the Academy of Medicine, New York, on sewer gas and the value of modern methods for excluding it from houses. This article throws considerable light on a question generally misunderstood.

Electric Lighting; its Fire Risks and their Remedies. Two articles by Prof. Henry Morton, President Stevens' Institute of Technology, Hoboken, New Jersey,

Illustrations, with description of the Arrangements for Heating and Ventilating the Bridgeport School House (intended to be a model building).

A continuation of Dr. J. S. Billings' Letters to a Young Architect on Ventilation and Heating, with illustrations of notable buildings.

A continuation of the "Sanitas" articles on Plumbing Practice (illustrated). Interesting to architects, builders, and plumbers.

Steam Fitting and Steam Heating, by "Thermus," a series of practical articles (illustrated), of great value to steam fitters and architects.

Illustrated Descriptions of notable jobs of Plumbing Heating, and Ventilating in Private Residences in the United States, including those of Mr. W. H. Vanderbilt and Mr. R. H. Bishop, of New York.

A series of articles on Petroleum Legislation in the United States, by E. G. Love, Ph. D.

A Report to the Greenock Board of Police on the Ventilation of the Sewers of Thirty-three Towns in England, compiled from information received from City Engineers, by Alex. J. Turnbull, C.E. Valuable to engineers and health officers.

A series of carefully prepared editorials on the Water Supply of New York, discussing the various schemes proposed for increasing it; also the measures to prevent waste. Opinions of prominent English engineers on the practice in England, and suggestions for American adoption, in connection with a controversy over the rules of the New York authorities with regard to the manner of flushing water closets. The letters and articles on the question of Valve *versus* Direct Supply to Water Closets are of great interest to manufacturers, plumbers, health officials and water works engineers.

Reports on Adulteration of Food and Drugs in the State of New York, being full abstracts of the reports of Professor Chas. F. Chandler, on Milk (fresh and condensed); Prof. G. C. Cornwell, on Butter (dairy and artificial), Cheese, Lard, Olive Oil, and Fruit Essences; by Professor A. H. Chester, on Canned Meats and Animal Foods; by Dr. E. G. Love, Ph.D., Cereals and the Products and Accessories of Flour, Special Artificial Foods for Infants and Idvalids, Baking Powders, Cream Tartars, Alum Powders and the "Alum Question;" by Professor A. S. Lattimore, on Canned Fruits and Vegetables, Vinegar Spices, etc.; W. H. Pitt, M.D., on Sugars, Glucose, etc.; J. E. Englehardt, Ph.D., on Wines, Beers, Spirits and Cordials; by J. Hoffman, Ph.D., on Crude Vegetable and Animal Drugs, Pharmaceutical Chemicals and their preparations; by Professor Caldwell, on Quinine Pills and Capsules; by W. G. Tucker, M.D., on Citrate of Magnesia and Seidlitz Powders.

These reports are on examinations made under the direction of the New York State Board of Health with a view of ascertaining the condition of the Food and Drug supply in the State, and the extent and character of the adulterations practiced. They are valuable to health officials, analysts, and manufacturers.

Notes upon some Prosecutions in Great Britain under the Food and Drugs Act, by Alfred Senier, M.D., F.C.S.

Paris Street Cleaning, by James Tallmadge Van Rensselaer. An elaborate and full account of the system and the cost of its maintenance—of value to city authorities.

Washington Drainage, a carefully prepared review of the evils complained of, and the various schemes proposed for the reclamation of the Potomac Flats and the sewerage of the city.

Price, bound in cloth, $4.00. Postage 40 cents.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S.A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

"Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

BRADSTREET'S:

A Journal of Trade, Finance and Public Economy.

Published by The Bradstreet Company,

279, 281, 283 Broadway, New York.

Terms, $5.00 *per year in advance, including postage.*

SINGLE COPIES, TEN CENTS.

Specimen Copies will be sent free upon Application.

As a financial and commercial newspaper the foremost purpose of BRADSTREET'S is to be of practical service to business men.

Its special trade and industrial reports; its weekly epitome of bankruptcies throughout the United States and Canada, and the summaries of assets and liabilities, are alone worth the subscription price.

The synopses of recent legal decisions constitute an exceedingly valuable feature.

As commercial transactions, in the wider sense, are coming to be more and more conducted on a statistical basis, the information contained in BRADSTREET'S is of the first importance both to producers and middle-men.

THE TRADE AND AGRICULTURAL SITUATION THROUGHOUT THE UNITED STATES AND CANADA IS REPORTED BY TELEGRAPH TO BRADSTREET'S UP TO THE HOUR OF PUBLICATION.

W. W. PERRINE, Manager.
☞ *Send for Circular.*

"THE DU BOIS" TRAPS.

These Celebrated Traps are made in the same way as lead pipe—Sound and Smooth, Even Thickness, no Seam, can be Flanged and Plugged as easily as waste pipe. These Traps are acknowledged by the trade to be the best made.

For sale by all dealers in Plumbers' Supplies.

STEWART'S PAT. VENTILATING TRAPS

IN STONEWARE AND IRON.

Simple in construction. No Valves to get out of order. Automatic in action. Cheapest and best ever introduced. One placed as an INTERCEPTOR between house and street sewer, or Cesspool, will positively exclude foul air from any house. *WE GUARANTEE THIS.*

Price Lists and Testimonials mailed by STEWART & CO., MANHATTAN POTTERY, foot of West 18th & 19th Streets, and 312 Pearl Street, cor. Peck Slip, New York.

RECENTLY PUT INTO THE **WHITE HOUSE** BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.
204 *Superior Street,*
CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made on Syphonage, for the National Board of Health proves this GRAVITY BALL **S** TRAP to be the only reliable safeguard against sewer gas.

Twenty-six thousand of them in use, giving full satisfaction to prominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED
IRON SEWER GAS
AND
BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. A valve and proper ventilation is indispensable. With front vent sealed, this Trap successfully resisted illuminating gas pressure. Tested by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon a block of stone and an 8-inch brick wall. Country residences, hotels and public buildings connected with drains and cesspools, are made safe with my Trap. By removing cover, access is had the whole length of the drain without cutting pipes Architects, Engineers, Plumbers and Builders, send for descriptive circulars. Trade supplied. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

SEWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be subjected by a commission appointed by the National Board of Health, and whose report was printed in full in THE SANITARY ENGINEER, it will be seen that the BOWER TRAP offered greater resistance to syphonage action than any trap manufactured for sale.

The Manufacturers solicit correspondence from the public, especially the Trade and Architects.

Will be pleased to answer any questions as to the application and effectiveness of this Trap. Send for circular.

B. P. BOWER & CO., Manufacturers, Cleveland, O

Salt- Glazed, Thoroughly Vitrified

Sewer and Drain Pipe,

MANUFACTURED BY

THE

RIDER COMPRESSION

PUMPING ENGINE,
(Hot Air),

For city or country residences where it is required to raise a supply of water, is the most *Perfect Pumping Machine* in the market. Its marvellous *Simplicity*, absolute *Safety*, great *Economy* and *Effectiveness*, render it far superior to all others. Can be run by any inexperienced person. Send for catalogue and price list to

CAMMEYER & SAYER,
93 Liberty St., New York,
and 20 W. Lake St., Chicago, Ills.
Please mention this Paper.

ERICSSON'S NEW PAT.

Caloric Pumping Engine

is especially intended for domestic use in lifting and forcing water from wells and cisterns, or from Croton pipes, to tanks on upper floors of buildings in city or country.

This pumping engine is entirely safe, no steam being employed, and is not liable to derangement.

All kinds of fuel will answer for this engine, but coal-gas is preferable, the consumption being only 15 cubic feet per hour. Besides, gas is handier and cleaner than coal or other combustibles. Servant girl can operate it.

Price for 6-inch cylinder, pumping 200 gallons per hour 50 feet:
With gas furnace, $210. With coal furnace, $220
Price for 8-inch cylinder, pumping 350 gallons per hour 50 feet:
With gas furnace, $260. With coal furnace, $275
Price for 12-inch cylinder, pumping 800-gallons per hour 50 feet:
With coal furnace only.....$375
Price for duplex 12-inch cylinders, pumping 1,600 gallons per hour 50 feet; with coal furnace only.....$550

The "EUREKA" Wheel

Pipe-Cutter.

☞ If the House of whom you purchase your supplies does not keep it, send direct to us.

The Body—is fitted with an adjustable Cast-Steel Jaw at the point where it comes in contact with the Pipe, which Jaw can be renewed at any time by simply removing one screw. By this system the wearing away of the Jaw (which is other cutters is the first part to give out) is effectually prevented, and this tool can be kept in first-class order at all times.
The Wheel Block—This is also of Cast-Steel, neatly fitted to its socket *and cannot be dropped out.* It is much more durable than the cast-iron blocks and is hardened at the point where the rod comes in contact with it.
The Handle—of this Cutter *is put on to stay*, and cannot be removed by the roughest usage, as it is a hollow iron handle, *cast fast to the Rod*, operating the block.
Manufactured by PANCOAST & MAULE, 243 and 245 South Third Street
PHILADELPHIA, PA.

Over 100,000 *now in use!*

AND
DEALERS IN SUPPLIES OF EVERY DESCRIPTION,
28 PLATT STREET, NEW YORK.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
GATE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

—SAMPLE ORDERS SOLICITED.—

A MODEL SLOP SINK,

IN ONE PIECE OF EARTHENWARE.

When set on and surrounded by White Glazed Tile, as shown, it makes the cleanest and most useful Slop Sink arrangement we know of.

It is provided with a Flushing Rim similar to the Hellyer Hoppers.

It is sold with the Flushing and Water Supply apparatus, that is made of Brass Pipe, as illustrated, or with a set of Combination Cocks to attach to Lead or Iron Pipes that may be concealed behind the wall.

It is arranged so that no overflow can take place when a pail may be set over the outlet hole and the water carelessly left running.

Persons wanting some such thing will find it worth while to take the trouble to call at our warerooms and examine it.

The apparatus complete, as shown, we designate as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 40.

When the Combination Cocks and the Hoppers only are wanted, it is designated as—

MEYER, SNIFFEN & CO.'S SLOP SINK APPARATUS, No. 41.

We have fitted up Show-rooms at No. 1 Pemberton Square, Boston, where our specialties can be seen. Persons living in Boston and vicinity are invited to call and examine them.

We have fitted up in our warerooms the various styles of Water Closet Apparatus that are to be taxed in this city $2.00, $5.00, $10.00 and $20.00 per year respectively. Architects, Plumbers, and Householders who may be interested, can there see which arrangement is best suited for their particular needs.

THE MASSACHUSETTS STATE BOARD OF HEALTH, LUNACY AND CHARITY.

The Boston *Herald* of Jan. 14 contains a long reply by Ex-Governor Talbot, Chairman of the State Board of Health, Lunacy and Charity, to the criticisms on that Board contained in Gov. Butler's recent inaugural address. Mr. Talbot thinks that the Board is all that it should be and is a great improvement over the system which it superseded, and complains of the hostility of the medical profession to the present Board, and especially of the conduct of some physicians, who, he says, accepted office under the new Board while really hostile to it and planning its overthrow. He sneers at medical men as being "theorists in sanitary affairs whom it was not the design of the State to encourage, and gives figures at great length to prove that the charities of the State are economically administered under the present arrangement. The paper is a shrewd attempt to avoid the real issue, somewhat on the cuttle fish plan, and as Mr. Talbot is the man who is responsible for the formation and subsequent operations of the present conglomerate board it is natural that he should rise in its defense.

The precise motives which induced Gov. Talbot, during his term of office, to work for the consolidation of the State Board of Health, which then had the highest repute of any similar Board in this country, with the Lunacy and Charity Commissions, and subsequently to take office in the conglomerate board and retain control of it, are, of course, unknown. The old Board had been charged with duty of looking after purity of the water supply of Boston, and was beginning to take some steps with regard to the pollution by sewage and refuse manufacturing products of rivers in the State. Gov. Talbot had extensive manufacturing interests which might have been interfered with, had the Board continued in this line of work, but under the conglomerate board no steps have been taken which need cause him any apprehension lest he might have to incur some increased expense to dispose of the waste from his factories in such a way as not to foul the water supply of other citizens of the State.

It was also fortunate for the party interests that the consolidation made it possible to give an office to one or two men who might have been troublesome if not thus provided for.

All of which shows how necessary it is to take commercial interests into consideration in attempts to regulate sanitary matters.

It is not at all likely that the present Board under Mr. Talbot's skillful guidance will make itself unpleasant to anyone, except possibly to those citizens who wish to have their wealthy and powerful neighbors prevented from poisoning their water, air and food; but, of course, everybody in this world cannot be satisfied. Mr. Talbot's watchful care even goes so far as to prevent as far as possible any publication by the conglomerate which might tend to cause dissatisfaction or alarm by calling the attention of the public to nuisances.

It will be seen that we have the highest respect for Ex-Gov. Talbot's tact and far-sightedness. Whether it will prove more than a match for Gov. Butler's way of doing things remains to be seen.

NEW YORK'S WATER SUPPLY.

No. I.

THE SUPPRESSION OF WASTE.

The condition of New York with reference to its water supply has frequently been referred to in THE SANITARY ENGINEER during the past three years, and the situation of Boston, Philadelphia and Cincinnati, to mention no smaller places, has suggested the propriety of reviewing the experiences of other cities in their attempts to husband their resources in the matter of water supply. We have for some years looked into the question of water waste prevention, and during the past summer have spent considerable time in investigating the methods adopted in the cities of Great Britain, with a view to being able to form an intelligent opinion as to the best practicable methods that might be employed in New York, making due allowance for the great difference in local conditions, as to the habits and requirements of water consumers and the methods of municipal administration. Briefly stated, the condition of New York is as follows: The Croton aqueduct began delivering water to this city to its fullest safe capacity ten years ago. That capacity was about ninety-five million gallons daily. To furnish this amount of water the flow line in the aqueduct has been maintained at a point nearly two feet higher than the designers and constructors of the aqueduct anticipated when it was built. The strain occasioned thereby has therefore been a matter of deep solicitude on the part of the engineers whose duty has been the maintenance of the conduit.

During the past ten years the population of this city has increased about three hundred and ten thousand. Manufactures, hydraulic elevators and other demands upon the limited amount of water have multiplied at an enormous rate, and no doubt faster than all has the waste increased.

Besides all this, during the fall of 1881 it was made painfully apparent that the storage capacity of the Croton reservoir was inadequate, and while in ordinary times the flow over the dam into the Hudson averaged during the past eighteen years three hundred thousand gallons daily, yet this average was of no avail in a period of extended drought. From the opinions of the ablest hydraulic engineers in this country it is evident that the present Croton water shed is ample for the present and future needs of this city, provided,

Digitized by Google

however, that additional storage capacity be arranged for and an additional conduit be provided to carry the water to this city.

The plan proposed by Messrs. Newton and Chesbrough and endorsed by Messrs. Jervis, Francis, Martin, and others, has been fully described in THE SANITARY ENGINEER and need not now be discussed. The carrying out, however, of their recommendations involves a work of such magnitude and an expenditure of so large a sum of money that the desire of political parties to have a hand in it is a natural consequence under our methods of popular government, and until politicians are satisfied in some way or other, the work can neither be begun nor completed. That is the issue and it might as well be realized first as last. The question then remains—under what party and under what conditions can the work be executed and the needless expense be restricted to a minimum amount? To this task the public spirited and intelligent taxpayers of this city should address themselves and endeavor to secure for the citizens of this metropolis the water that must be had, and on as favorable terms as a compromise between political demands, intelligent design, honest and prompt construction will admit of.

As these questions are beyond the scope of the following articles, we shall confine them to the description of methods by which present and future suffering can be mitigated, and that is nothing more or less than the prevention of waste, for even should the work of building a new aqueduct be begun at once, it will probably be seven years before an additional gallon of water can be delivered through it; meanwhile the probabilities of suffering are not pleasant to contemplate.

The consumption of water in New York with the present reduced pressure in the mains is about 75 gallons daily for each inhabitant, which amount is nearly three times as great as Liverpool and Manchester use with their greatly increased pressure. There is no doubt that after making the most liberal allowance for the difference in the habits and usage of our people, fully 40 gallons per head are wasted, and of this amount 25 gallons at least may be considered as preventable waste.

At the ratio of increase of population during the past ten years, another seven years will add two hundred thousand to our numbers, which means a decrease of nearly one-fifth in the water pressure now maintained.

It is obvious, then, that in order to supply the demands of this increased population and retain the present inadequate pressure, one-fifth of the amount delivered or about twenty-million gallons daily must be saved from the amount now wasted, and it is a matter much to be regretted that so little has yet been done in that direction.

In subsequent articles, therefore, it is proposed to describe the experience in other cities and to point out how much yet remains to be done, here and elsewhere, to use to the best advantage what we now have. [TO BE CONTINUED.]

Mayor Edson's commission of business men to inquire into the best plan for improving the water supply of New York is busily engaged in listening to the schemes of projectors, most of whom have a keen eye for business. The *Evening Post* published a *resumè* of the principal projects which it has been proposed to bring before the commission. None of them are new, and some of them are venerable, having been proposed and rejected over and over again for the last fifty years. But they are urged by practical men, who agree with the President of the Dock Department, that engineers "ain't no use, anyhow." The fine disregard of conventionalities which characterize this business men's commission was displayed at one of the meetings by a commissioner offering to take $100,000 of the stock of a company to carry out one of the projects, and this, too, when he had only heard one side of the question, and had not the remotest conception of the arguments on the other side, or the reasons which had so far proved sufficient to deter capitalists from carrying it out. We do not propose to discuss the question of propriety involved in the making of such remarks at this stage of the proceedings, but if one of the commissioners is going to pledge himself to put up a stake on a separate plan, there will have to be another committee appointed to arbitrate between the commissioners. There are known to be at least five speculative corporations formed on paper, any one of which is willing to take a franchise from the city and guarantee a better water supply. How much that guarantee would be worth after the franchise is obtained, is another question. The property owners in Fulton and John streets know something about guarantees from political corporations. We hope that the commission now sitting may reach a wise conclusion, but we suggest to them that it would be wise, pending their deliberations, to restrain their commercial tendencies and abstain from offering to take any pecuniary interest in any project submitted to them.

A new health ordinance for the city of Montreal is now under consideration by the Board of Health of that city, the length and profusion of detail of which may be inferred from the fact that the synopsis alone of the four hundred and odd clauses of the law occupies three columns and a half of the Montreal *Daily Star*.

From this synopsis, which is so brief as to be in fact little more than an index, it is, of course, impossible to judge of the merits of many of the sections, but most of them appear to be the same as those of the New York City code, which is certainly a good one so far as it goes, when it is enforced.

The proposed ordinance is meeting with some opposition on the ground of economy, and the French element of the city, like that of New Orleans, is opposed to sanitary regulations of any kind, but it seems probable that with some amendments it will become a law.

What a considerable amount of sewer gas is manufactured on the premises. Not all the bad air, foul water, and vile smells are due to plumbing. Yet, when they are observed around the house, they are pretty sure to be referred to anything rather than to the source which is responsible for them—want of care and cleanliness about the household arrangements—and very often the plumber is abused when the censure should fall on the mistress or the maid. The other day, in Philadelphia, five dead rats in a well, and one decaying in the well bucket, satisfactorily explained the bad taste of the water which had alarmed the whole family. Yet these people would doubtless have been the first to talk of leaky drains and soil pollution. There is a moral for housekeepers in the remark of the Chatham street dealer in second-hand clothing. When he came into a Third avenue car, a vile smell attached somewhere to him or the bundle of clothes, and to divert suspicion from his wares, he said to the passengers: "Dot ish not the close vot schmelz, dot ish me."

Now the Tree Planting and Fountain Society of Brooklyn is incorporated, and its officers chosen: President, Mr. John W. Hunter; Vice-President, David M. Stone; Treasurer, Gordon L. Ford; and Secretary, Richard M. Montgomery. The general object is the beautifying of the city of Brooklyn, to be attained through the special means of the planting of trees and the erecting of drinking fountains. Of the beauty of the first, Connecticut, after the patient and vigorous endeavors of Mr. B. G. Northrup, will testify, and so will many other rural communities where public spirit and taste have inaugurated tree planting movements. Of the utility, the never-ceasing crowd about a drinking fountain of a large city, is abundant proof. The Society will issue a pamphlet, we understand, before the spring, which will give plain directions about the best varieties of trees, and the proper way of setting out in the streets of a city. Of all the miserable things and poor among the miseries of a city, most miserable is the uncared for tree, with its roots below the close, stifling pavement of a city street.

To secure sweet milk for the infants of the poor is a difficult matter. It has taxed the authorities to check the sale of skim-milk, and even if this is effectually accomplished, and sweet wholesome milk is bought by the poor, it turns sour in the heated, impure atmosphere of the tenement house. To reach this evil, the State Charities Aid Association, in their last annual report, advocated the maintenance of places in those quarters of the city where most needed, at which pure milk in small quantities can be bought during the entire day. They ask for private benevolent enterprise to start the plan, and express the belief that such places carefully managed would pay expenses.

Mr Emil Kuichling, Assistant Engineer of the Rochester Water Works, has reported some of his conclusions about the causes of the epidemic at Binghamton, N. Y., which the State Board of Health appointed him to assist in investigating. Mr. Kuichling says there have been more than five hundred cases of sickness with mild vomiting and purging. It appears that the water supply of the city is obtained from the Susquehanna river, which has been at very low water for some time. A mile and three-quarters above the pumping works the sewage of the New York State Asylum for chronic insane persons, drains into the river after having been imperfectly filtered through earth. It is the opinion of those who have been engaged in the investigation, that the disease is due to the impurity of the water.

The explosion of a house drain has led to a singular suit just decided in Philadelphia. It involved the relative responsibility of the city, and the houseowner for the condition of the house drains, for the plaintiff, alleging that he had suffered damage by the blowing out of the back wall, the ripping up of floors, and the injury of two persons, brought the action on the ground that the city should so construct and guard the sewers, that an entrance of gas into houses could not take place. In its defence the city pleaded that it had no control of house drainage, and that premises should be trapped against the sewer, and the drain ventilated and soil pipes carried above the roof, but all these precautions had in this case been neglected. In consequence, a leaky gas pipe in the street sent gas into the house drains, and through the drains imperfect joints, it found its way to the kitchen range and exploded with the resulting damage. The result of the action was a non-suit; plaintiff could not recover because of his own negligence in having imperfectly planned drains.

The movement for a plumbing ordinance is progressing in Philadelphia. A meeting of persons interested in sanitary work was held the 16th instant, in conference with the committee on survey. It was decided that plumbers must register, as in this city. The suggestion was indorsed by the plumbers present. A conference committee, consisting of seven plumbers, seven citizens, and seven engineers and experts, has been appointed to prepare the ordinance, and Mr. John J. Weaver has been chosen President and Mr. William Harkness Secretary of the plumbers' section of the committee.

The prizes offered last August by Mayor Low, of Brooklyn, for the best plans for school buildings of moderate cost, have unfortunately attracted little attention from the architects. After several postponements the decision of the committee of award was made known last week, and was opposed to an award at all, for it seems but one plan was sent in—for a $15,000 building—in so incomplete a shape that the committee recommended against the giving of the prize. Mayor Low, however, in recognition of labor spent in preparing the one plan sent in, sent to the author of it the amount of the first prize, two hundred and fifty dollars; and the mayor did right.

GENERAL STEAM SUPPLY FOR NEW YORK CITY.

THE WORK OF THE N. Y. STEAM HEATING CO.

The following description of the plant of this company has been prepared especially for us by one of our staff, and we trust it will prove of interest to our readers.

The most stupendous undertaking ever contemplated for the production of steam, that has a prospect of success, is that now being put to a practical demonstration in the streets of New York by the New York Steam Co.

The scheme embraces the establishment of some twelve or fourteen stations (named after the letters of the alphabet), to be distributed through the city, and to be erected as the requirements of the districts seem to demand and justify.

The annexed diagrams represent "Station B," which is situated on the south side of Greenwich street, between Courtland and Dey streets, and is built on three 25-foot lots—Nos. 170, 172 and 174.

Figure 1 is the ground plan, and shows the irregular shape of the building; with the foundations for chimneys and piers. Figure 2 is the first story plan, and may be properly said to represent each of the four floors on which the boilers are to be set. Figure 3 is a section about on the line *A' B'*, and shows a view through one chimney on its greatest axis, on a horizontal plane, with an approximate position and setting of the boilers and the floor trussing and columns. Figure 4 is a section on the line *C' D'*, showing a chimney on its shortest horizontal axis; and Figure 5 is the façade, whose principal feature is the immense opening in the brickwork (*j*), which extends from almost the roof to the water table, and which is fitted with portable or easily moved sections, to allow for the ingress and egress of heavy machinery.

The positions marked *B*, between the columns, are where the boilers are placed; with their fronts and fire doors facing on the fire room *D*. It is intended to have 4,000 *horse power* to a floor, each position between the columns containing 250 horse power, making for the four floors of boilers an aggregate of 16,000 horse power—presumably the greatest in the world under one roof.

The boilers used are the Babcock and Wilcox Water-tube Boiler (see Fig. 6), and there may be said to be two boilers in a nest (between each set of pillars), or to the same fire grate, the horizontal steam and water drums of each being connected by a large cross pipe, virtually making them one boiler.

These boilers are composed of lap-welded wrought iron tubes, placed in an inclined position as shown, and connected with each other, and with a horizontal steam and water drum, by vertical passages at each end, while a mud-drum connects the tubes at the rear and lowest point in the boiler.

The end connections are in one piece for each vertical row of tubes, and are of such form that the tubes are "staggered" (or so placed that each horizontal row comes over the spaces in the previous row). The holes are gauged, and the tubes fixed therein by an expander. These are connected with the drum, and the mud-drum also, by short tubes expanded into bored holes, doing away with bolts, and leaving a clear passage-way between the several parts. The openings for cleaning opposite the end of each tube are closed by hand-hole plates, the joints of which are made by milling the surfaces to an accurate metallic contact. They are said to be tested to 500 pounds per square inch, and to be iron to iron, and to have no rubber or perishable substances between the joints.

In setting the boilers are suspended, and do not rest on the brickwork or fire front, and are set substantially as shown, the fire being under the front or high end of the tubes and the products of combustion passing between the tubes into a chamber under the steam and water drum, then down between the tubes to the back of the bridge-wall, thence up again and to the chimney.

The circulation of the water within these boilers is up through the tubes, where it enters the drum and flows backward and down again to the tubes, giving, it is claimed, extraordinarily good results as a steam maker and preventing, to a great extent, the formation of deposits upon the inside surfaces and allowing all loose substances to settle into the mud-drum.

One of the objects, we are informed, for selecting these boilers for the peculiar situations they here occupy, aside from their high efficiency and the small cubic capacity they occupy for horse power, is their supposed absolute safety from any kind of burst or explosion that would materially injure the building or other boilers above or below them.

We will now follow the water from its entering the boilers through its changes and stages to the consumer and back again to the boilers in the station and describe details as they suggest themselves in that order.

There are no feed water heaters used, the return water, with the steam necessary to force it round its circuit, presumably being sufficient to heat the water necessary to be supplied to make up for the loss caused by steam supplied to engines.

The water enters the boilers before described, where it is converted into steam, thence it is passed through about an 8-inch pipe to about a 18-inch main, *see dotted lines q r*, which runs above and in front of the boilers, through the fire room *D*, and connects with the vertical cylinder *b*, which conveys the steam to the basement, preparatory to distributing it to the street. The main connections from the drums of the boilers to the pipe *r* are partly composed of copper, and are supplied with bends of long radius, to give elasticity to the branch and an easy flow to the steam. Each is fitted with an angle stop valve of special design, the position of the valve being close to the main pipe *r*. This valve, an idea of which can be had from the diagram,

FIG. 2.

FIG. 1.

FIG. 3.

FIG. 5.

Fig. 7, is to prevent the steam from the whole system flowing backward and escaping through one boiler, should any part of it give out. It is a combined stop and check valve; the steam from the boilers as it passes into the general system having to force its way under the disk which it raises, but which would be instantly thrown down, checking a back flow from the main if the bursting of a tube caused a difference of pressure between the main and one boiler.

From the bottom of the cylinder *b*, which is 3′ 6″ in diameter and into which the main horizontal pipe from each floor connects, steam is distributed to the mains in the street by large branches which lead off in different direc-

FIG. 7.

tions, the pipes which now lead to the street passing through the arched opening in the wall *g*, Fig. 5. These pipes are supplied with stop valves near the cylinder and are for the purpose of shutting off one street section or sub-division without effecting the others.

The largest pipes laid in the street are fifteen inches in diameter and run down to about eight inches and are wrought iron lap welded tubes, in lengths of about twenty feet, with flanges on their ends and bolted together. The flanges are what is commonly known as "flange unions" and are faced true and brought together on a cocentrically corrugated copper gasket, nothing but a lead paint being used to form the joint.

The pipes are not screwed into the flanges in the ordinary way, but are inserted and expanded in the same manner as a boiler tube; a groove being made on the bore of the flange, into which the metal of the end of the pipe is pressed by a Dudgeon expander.

[TO BE CONTINUED.]

MALARIA

BY GEORGE M. STERNBERG, M.D., SURGEON U. S. A.,
Late Member of the Havana "Yellow Fever Commission" of the National Board of Health, Cor. Member of the Epidemiological Society, London; F. R. M. S., etc.

No. III.

We have seen that malarial fevers must be due, directly or indirectly, to the action of bacterial organisms, as they result from a miasm—malaria—evolved during the decomposition of vegetable material. And vegetable decomposition is due to the action of living ferments. These living ferments—malarial germs—can scarcely fail to find their way into the atmosphere in the neighborhood of marshes and malarious soils. Indeed, we have ample evidence that the germs of a variety of bacterial organisms are constantly present in the atmosphere, and there is no reason for supposing that these form an exception in this regard, although, according to our belief, no *specific* malarial germ has yet been demonstrated. Being in the atmosphere they must find entrance to the bodies of those who respire this atmosphere. But not necessarily to the blood. The atmosphere constantly contains putrefactive organisms, and a sterilized organic fluid exposed to unfiltered air quickly undergoes putrefaction, when the temperature is favorable. But the blood of animals respiring this atmosphere does not putrefy, although a very putrescible liquid, either within the vessels of a living individual or in a sterilized flask placed in a culture oven, if it be introduced into this flask directly from the circulation, with precautions which prevent contamination by atmospheric germs. What then becomes of bacterial organisms which are introduced into the respiratory passages during the act of inspiration? The moist mucous membrane which lines these passages is a germ-trap which arrests floating particles of all kinds. Those which are deposited upon the membrane lining the buccal and nasal cavities find their way into the stomach, or to the spittoon and pocket handkerchief—not always; while those which enter the bronchial tubes are doubtless deposited before reaching the smaller ramifications of these tubes or the air-cells at their extremities. By the action of the cilia of the epithelium, covering the bronchial mucous membrane, these particles, of whatever nature, are constantly carried back toward the entrance of the bronchi. We have here an admirable provision of nature for preventing germs from gaining access to the blood by way of the lungs. That it is always efficient is not claimed. But that suspended particles in the air are more likely to find their way into the alimentary canal than into the blood by way of the lungs is undoubtedly true. As a matter of fact we find, in healthy persons, that saliva, or mucus from the mouth or nares, contains an abundance of bacteria of various species, and that the discharges from the bowels also contain a multitude of these minute organisms, which evidently multiply within the body at the expense of the organic material ingested as food.

There can be but little doubt that the chemical products evolved during the active growth of these living ferments, within the body, are the same as those produced external to it, in the cesspools, or marshes, which are the normal habitat of some of them. If, then, these products are poisonous, it is not improbable that the poison factory may be either within or without the body.

Fortunately these foreign germs do not find in the intestine of man and the lower animals conditions as favorable to their continued development as those which exist in their native cesspools and marshes, and one infected with them may often withstand their effects, if in vigorous health, when they do not receive constant reinforcements from without.

This hypothesis furnishes an explanation for the fact that after exposure in an intensely malarious atmosphere the symptoms of malarial poisoning are sometimes developed almost immediately, from a toxic dose of the poison? And also of the fact that, in other cases, the characteristic febrile paroxysm does not occur until some time after exposure—period of incubation, or time for development of germs and poisoning from within (?)

Whatever may be the true explanation of the *modus operandi* of the malarial germ, or germs, *i. e.*, the organisms which constitute or produce malaria, it is evident that the *biological factor* demands especial attention in future investigations relating to the nature of malaria. And no explanation of the occasional epidemic prevalence of malarial diseases in sections previously free from them is likely to be satisfactory, unless this element of the problem is duly considered.

It is claimed by some epidemiologists, and apparently upon reliable data, that malarial epidemics commonly precede or follow epidemics of other diseases, and particularly of influenza, cholera, dysentery and plague. In Europe it has been noted that influenza and malaria rarely prevail extensively, at the same time, but that an epidemic of the former disease is very commonly followed by one of the latter. Malarial fevers and dysentery, however, may occur simultaneously both endemically and epidemically, and, indeed, the two diseases may be associated in the same individual.

The mortality in the entire United States from malarial fevers, during the last census year (1880) was: males, 10,276; females, 9,985; total, 20,261, giving a proportion of 27.61 per thousand of all deaths from reported causes.

In the North Atlantic region (Grand Group I.) the proportion of deaths from malarial fever to all deaths recorded was 4.56 per thousand. *In the Lake region* (Grand Group VII.) the proportion was 9.74 per thousand.

In the Gulf States (Grand Group IV.) the proportion was 65.85 per thousand, or more than fourteen times as great as in the North Atlantic region.*

These figures fall far short of showing the mortality caused by malaria. For many of the victims of this widely-spread poison do not die directly from malarial fevers, but succumb to organic visceral maladies resulting from repeated attacks of intermittent fever, or to other diseases which prove fatal because the vital resistance of those attacked by them is at a low standard from chronic malarial poisoning.

If, instead of mortality only, we could have figures showing the total amount of sickness produced in the United States by malaria, and the total annual loss to the country from this tax upon labor, which is levied upon the health and strength of the laborers, we would be astonished at the enormous amount of suffering, and at the pecuniary loss represented.

The question, What is Malaria? is, then, one of national importance, and sanitarians should unite in the demand

* Figures obtained from the *Medical News* of Nov. 25, 1882.

FIG. 4.

FIG. 6.

that properly directed investigations be undertaken by some branch of the government service, and continued, with all the facilities required, until it is finally answered.

It is evident that in such an investigation the greatest prominence should be given to biological studies relating to the micro-organisms present in malarious waters and soils, in the atmosphere of malarial localities and in the bodies of those suffering from malarial poisoning. But an intelligent search for malarial germs in any of these situations can only be made by one who is already familiar with the bacterial flora of organic infusions, of non-malarial atmospheres, and of the healthy human mouth and intestine. For "germs" which do not produce malaria are found in great variety in all of these situations, and a thorough knowledge of the morphology, physiology and life histories of these harmless organisms is the only safeguard against the *pseudo-discoveries* which have done so much to retard the progress of science.

Modern methods of research enable us to isolate bacterial organisms, and to obtain "pure cultures" of various species for microscopical observation, and for experimental purposes. If these methods were applied to the study of all the species found as harmless parasites in the alimentary canal of man and the lower animals, we would be better prepared to recognize "disease germs" in these situations and to trace them from the infected individual to their source.

In an experimental investigation relating to the etiology of malarial fever, one of the first steps should be to verify the truth of the statement that certain animals—horses, cows, dogs and hogs (Hertz, in Ziemssen's Cyclopædia)—are subject to the disease. If this be found to be true, the most susceptible and available animal should be selected, and pure cultures of various organisms obtained from malarious atmospheres and waters should be administered *per orem*, rather than subcutaneously, as in the experiments of Klebs and Tommassi-Crudeli upon rabbits.

The limits of the present article do not permit of a more extended account of the geographical distribution of malaria; of its apparently erratic epidemic prevalence in the New England States at the present time; or of the methods of research, upon which we must depend for a final answer to the question asked at the outset, and which we should continue to ask by the experimental method until a definite answer is obtained, viz.: *What is Malaria?*

SIMPLE METHODS OF SECURING PURE AIR.

Some simple methods of using the common stove for ventilating rooms are described by Dr. D. F. Lincoln in his paper on "School Hygiene," which is printed in the Second Annual Report of the Board of Health of the State of New York, for 1881 and 1882.

FIGURE 1.

In a variety of ways, Dr. Lincoln says, the stove or stove pipe can be used to expel air from the room. The "jacket" or metal screen is a thing of which no stove in an inhabited room should be destitute, as a protection from heat. But it is mentioned here as affording an aid to ventilation. Figure 1 shows how this is done. A metal cylinder, considerably wider than the stove, is placed around the latter, and its edge is fastened to the floor. A good sized pipe is then carried through the floor, under the stove, and led through the house wall at *A*. Guard the inlet with a screen of wire at *A*, and a large supply of pure warmed air is drawn into the room. This is one of the cheapest and best devices for warming and ventilating. Some prefer to extend the jacket around only a part of the stove and leave the door uncovered; or the jacket may stop at the bottom of the stove and be made fast to the latter at that point. The arrangement is equivalent to a "portable furnace," such as is usually placed in a cellar or a basement hall.

In Figure 2 a stove is represented standing close to an open window. The movable semicylinder of metal, commonly used for a screen, has been so placed as to enclose the stove on all sides, except that towards the windows.

FIGURE 2.

Cold air may then be freely admitted; it is quickly warmed by contact with the stove and is thrown upward with the general current.

Figure 3 shows air brought in so as to be warmed by contact with a stove pipe. The inlet flue is enlarged and runs up with the stove pipe, like a jacket, for same distance.

Figure 4 shows how a stove pipe may assist in removing injurious air. The diagram represents a two-story house with a chimney which comes down to only a very short distance from the roof. The opening into the chimney for the stove pipe is enlarged so as to receive a much larger pipe,

FIGURE 3.

which encircles the stove pipe like a jacket. This jacket may stop short at *A*, or may be carried through the floor to *B*, in the first story. It will secure a draught from either story as may be arranged. The idea of this and the preceding figure is borrowed from an article in the report of the Michigan Board of Health for 1879.

A chimney, into which a smoke flue discharges, may be opened at any point *below*, and not too near, the point where the smoke enters. Many rooms, for instance, have chimneys which reach to the floor, while the stove pipe enters near the ceiling; such chimneys ought to lend their powers to the task of ventilating the room by an opening near the floor. The latter ought to be closed when the fire is making.

The term "aspiration" is applied to the suctional force of heated flues. The method by aspiration has been used systematically in large school houses, making one shaft do the work for the whole house; in which case the room flues are often made in the floor, running across to the brick shaft. In some cases all the flues are made to descend to the base of the shaft before entering it. A discussion of this matter on a large scale is beyond the purpose of this paper. Where the number of rooms is great,

FIGURE. 4

and the exposure to the weather is different in different parts of the building, unequal action is likely to occur.

As regards a heating apparatus, furnaces in cellars are most manageable when standing directly under the rooms they are to heat, or at the windward corner of the house; in other cases they sometimes play strange tricks, refusing to yield warm air, or drawing it out from the room. A steam apparatus has this advantage, that the heat can be placed just where it is needed. Whenever a supply is wanted in a room, a tin pipe (wood should be avoided as unsafe) can be led down from that point to the cellar, and a steam coil put there, encased in a wooden box lined with tin, to save heat, which has a value for stormy weather; but in no case should air be taken from cellars.

Something more should be said of the cellar. It cannot be too often repeated, that the purity of cellar air lies at the foundation of the purity of house air. The danger of severe and sudden illness lurks in cellars as often as in sewers. The common practice in regard to cellars is to bury the drain under its floor, to place water closets in its darkest corners, to store combustible rubbish in wooden bins (I have seen great heaps of paper scraps), to pile away old rotten boards and clothes, to hang children's outer garments in it; in short, there are few uses of a menial sort to which it is not put. The cellar is often without a proper floor, often is very dark and close for want of windows, often is darkened by placing the heater boxes in front of windows.

To these sources of pollution (for darkness is one source) add the fact that in cold weather a powerful outside pressure exists, forcing air into the cellar and thence into upper parts of the house. It is too much to expect that an average cellar will be so pure, so free from all these objectionable things, that air may safely be taken up from it by furnaces for the consumption of the house.

Let the floor be concreted or asphalted, so as to be air and water-tight. Put no drain underneath, unless in a trench with a wooden or stone cover. Put *one* large trap outside of the walls for each sewer, ventilate it by an opening just inside the trap; run the soil pipe up full size several feet above the roof, and protect it from rain; ventilate the trap under each washstand; have no water closets in the cellar; or if they be thought necessary, isolate them in separate chambers of masonry with abundance of light, accessible to the children from the outside only of the house. Give a plenty of windows, and good height, and keep the walls whitewashed.

ZYMOTIC DISEASES IN NEW YORK CITY.

BY DR. JOHN T. NAGLE,

Deputy Register of Records.

NEW YORK, *Jan.* 10, 1883.

To the Editor of THE SANITARY ENGINEER:

I have the honor to submit the following comparative statement of the deaths from some of the more prominent zymotic diseases, and the number of contagious diseases (reported to the Sanitary Bureau) in the City of New York, during the year ending Dec. 31, 1881 and 1882:—

DISEASES.	Deaths.		Cases of Contagious Diseases Reported.	
	1881	1882	1881	1882
Small-Pox	451	259	1,342	708
Measles	429	913	3,116	4,637
Scarlatina	1,964	2,066	7,338	6,362
Diphtheria	2,249	1,525	5,272	3,507
Croup	1,034	729	.....	.....
Whooping Cough	286	658	.....	.....
Typhus Fever	160	65	568	207
Typhoid "	446	362	965	686
Malarial "	605	540	.....	.....
Puerperal "	53	59	.....	.....
Diarrhœal Diseases	4,270	4,050	.....	.....
Cerebro-Spinal Fever	461	238	556	236
Other Zymotic Diseases	1,083	958	.....	.....
Total Deaths from Zymotic Diseases	13,495	12,422	.....	.....
Total Deaths from all causes	38,624	37,924	.....	.....
Estimated population in the middle of the year	1,242,533	1,279,560	.....	.....
Death Rate per 1,000 of the population	31.08	29.64	.....	.....

By the above table it will be seen that there was an increase in the number of fatal cases of Measles, Scarlatina and Whooping Cough during the year, and a decrease in all the rest of the contagious and infectious diseases. The average age of those who died during the year of Small-Pox, was 15y. 6m. 6d.; Measles, 2y. 4m. 26d.; Scarlatina, 4y. 0m. 21d.; Diphtheria, 4y. 2m. 10d.; Memb. Croup, 2y. 9m. 13d.; Whooping Cough, 1y. 4m. 21d.; Typhus Fever, 39y. 1m. 3d.; Typhoid Fever, 25y. 9m. 2d.; Cerebro-Spinal Fever, 11y. 0m. 28d., and Malarial Fevers, 27y. 4m. 2d.

The residents of tenement houses suffered more from the effects of contagious and infectious diseases than those who dwell in less crowded houses. There is not a single disease of the ten zymotic diseases previously mentioned, where the deaths in tenement houses did not exceed those reported in dwellings which contained less than four families. The following table may prove of interest in support of the above statement:—

DISEASES.	DEATHS.			
	In houses containing less than 4 families.	In houses containing more than 3 families.	In Hotels and Boarding Houses.	In Institutions.
Small-Pox	13	41	1	204
Measles	128	580	4	199
Scarlatina	574	1,412	24	72
Diphtheria	478	978	6	57
Memb. Croup	179	518	.....	36
Whooping Cough	174	447	4	31
Typhus Fever	.....	7	.....	57
Typhoid "	78	132	2	146
Cerebro-Spinal Fever	64	138	3	33
Malarial Fever	202	284	6	47

The total number of deaths for the year was 37,924; or this number 20,096 were males, and 17,828 were females; 24,494 were born in the United States; 13,430 were foreign born; 703 were colored, and 17,520 (9,317 males and 8,203 females) were under 5 years of age. The following is the mortality by ages: Under 1 year, 9,867; between 1 and 2 years, 3,586; between 2 and 3 years, 1,882; between 3 and 4 years, 1,297; between 4 and 5 years, 888; between 5 and 10 years, 1,635; between 10 and 15, years, 505; between 15 and 20 years, 759; between 20 and 25 years, 1,555; between 25 and 30 years, 1,751; between 30 and 35 years, 1,696; between 35 and 40 years, 1,916; between 40 and 45 years, 1,687; between 45 and 50 years, 1,588; between 50 and 55 years, 1,500; between 55 and 60 years, 1,193; between 60 and 65 years, 1,262; between 65 and 70 years, 959; between 70 and 75 years, 905; between 75 and 80 years, 655; between 80 and 85 years, 523; between 85 and 90 years, 207; between 90 and 95 years, 61; between 95 and 100 years, 34; 100 years, upward, 13.

The deaths by Quarters during the year were as follows:—

	Total Deaths	Males	Females
Three months ending March 31, 1882	10,288	5,502	4,786
" " " June 30, 1882	9,618	5,102	4,516
" " " Sept. 30, 1882	10,349	5,440	4,909
" " " Dec. 31, 1882	7,669	4,052	3,617
Total	37,924	20,096	17,828

J. T. N.

THE TRAP ON THE HOUSE DRAIN.

PUEBLO, COL., *Jan.* 12, 1883.

To the Editor of THE SANITARY ENGINEER:

These cities, Pueblo and South Pueblo, with a population of about 20,000, are, at present, constructing a good system of sewerage, under the management of city engineer J. S. Green, the main trunk sewer of both brick and pipe. They have lateral pipe sewers extending through alleys; therefore the house drainage is through the rear of the house instead of the front, as usual. Partly from prejudice and partly from the mildness of our climate, the people of this city prefer out-door water closets (not all, of course, but the majority,) and the rear drainage system makes this very handy for closets. I use the J. S. Mott self-flushing hopper, with Bartholomew valve placed three feet under closet floor, the waste connected with sewer.

Having explained this part, I will state that my object in writing to you was in regard to an ordinance drafted, I presume, by our city engineer, prohibiting a running trap on the main house drain, requiring to run the soil pipe untrapped through the roof. Now, I have no objections to this for new work or work overhauled and properly reconstructed, but nearly all the plumbing work in this city has no soil pipe above the highest fixture, which is generally on the first floor, and the owner is either unwilling or unable to make this change, so I have substituted for this kind of work something like the plans sent you in this letter. But still the engineer objects to the trap, and calls it a hot bed of disease, but does not recommend anything better. There is now work awaiting your decision, whether this trap is proper or not. The work I have already constructed of this kind gives excellent satisfaction. Now, these plans relate only to this kind of plumbing; without soil pipe above roof.

If you can spare room in your valuable paper to print this and reproduce the cut, if correct, and state your objections, if any, you will confer a benefit on this community, and a subscriber. Yours, very respectfully,

DOUGLASS MITCHELL.

P. S. Please state whether a large grease trap in the yard is now considered necessary for ordinary kitchen drainage?

[Under the circumstances you name it would be criminally stupid to remove the trap between sewer and house; it is equally so to permit any soil pipe to terminate inside a house. The least that can be done is to insist that every such pipe shall be at once extended through the roof. Unless your public system of sewers is in better condition now, and likely to remain so, than most sewers in this country are, we should insist on the main trap and fresh air inlet, though the form of running trap that you show is objectionable. A half S trap with a T branch, as shown in Vol. V., page 81, is much better and less likely to stop up.

The location of the grease trap depends on circumstances. The necessity for its use depends on the amount of cooking done and amount of greasy water allowed to run to waste. Your plan could be improved as follows: use form of main trap above described, assuming your climate will permit it, place trap immediately under the hopper; flush the hopper from a cistern and abandon the valve which affords direct communication between hopper and drinking water supply, and moreover gives an inefficient flush.

Vent the bath tub trap, or, if that cannot easily be done, use a kind of trap not so readily syphoned.]

WATER CISTERNS.

Our readers are probably aware that London is still laboring under the disadvantage of an intermittent water supply, requiring cisterns to hold a supply for all purposes of the household. A correspondent of the London *Daily News*, has been making an inspection of these cisterns, and we quote the following from his account:—

The very first cistern I looked at would, I fancy, if I could have seen inside it, have been a very good specimen for the museum. It was just the length of my umbrella, and somewhere about a foot or fifteen inches square. It had no cover and was fixed up over the water-closet on the one side and the copper on the other, and without being protected from dust by the sloping roof of the wash-house it was so near to it as to render it very awkward indeed to see into it even with a light. I confess I did not attempt to get any more over it. The occupant of that part of the house said she had been there ten years, and she admitted, rather reluctantly, I thought, that she could not remember that that little box had ever been cleaned out. The outside had been painted once, but nothing further had been done to it that she knew of. It was as I have said, over the closet, from the interior of which it was separated only by rough boards forming the ceiling, and thoroughly pervious to effluvium. This was not an isolated arrangement either. I found several precisely the same, only that the record did not run back quite so far. One tenant had been four years in her house, which she shared with a second family occupying the upper floor. These two families both drew their supplies of water from just such a cistern as I have described, and during the four years' residence of the tenant-in-chief it had been cleaned out once. She had evidently never regarded it as a matter she could be expected to attend to herself. It was, she considered, the landlord's business, and though she did not attribute the impurity of the water to the state of the cistern, she complained seriously that if she took a jug of water to her bed-room at night, there was always a sediment at the bottom of it in the morning, and it smelt "filthy" she added. Another woman showed me her cistern of just about the same size—that is, somewhere about a yard long, twelve or fifteen inches deep, and the same in width.

"And when was it last cleaned out?" I inquired. "Cleaned out?" returned the old lady; "why, it was new put in when I came here, and I ain't been here five years." In one or two cases I found a very sensible appreciation of the importance of a clean cistern. "Yes, sir," said one woman, "I give it a good clean out every now and again." "And how do you do it?" I inquired. "Well, I get up on something on the top of the copper and scoop out the water with a saucer, and then well wipe it with a cloth," replied the woman. "And it's all slimy muck inside," she added. Many times during my inquiries I was fairly amused to observe the rigorously economical arrangements of the water company, resulting in the utmost extravagance. "Makes me swear, this tap do," said one woman. "Look there, sir; that's all I can get, and if I want a bucket o' water I has to wait half-an hour for it." That was the case in several houses I visited, and the consequence was that most of them had tubs and buckets standing permanently under the taps, and the water was always allowed to flow in and keep them full, whenever it was on from the street. In several cases I had complaints that the "patent" fittings never acted, and that people were deluged whenever water came in. One poor woman whose walls and floors were saturated told me that she had suffered from an overflow from her cistern ever since this time last year. The inspector came then and ordered the landlord to put the thing right in 21 days. That was last autumn, and the landlord took not the slightest notice of the order, and the water still poured in every time it was turned on from the main, and had done so ever since.

Now I must not pretend to believe that the water arrangements I have been describing are fair specimens of the average London supply. But it is a fact, that without any knowledge whatever of the district I went into, I found what I have described at once and without difficulty. It is reasonable to assume, therefore, that such abuses

Digitized by Google

must be very common indeed. It is true that I had had a little conversation with a couple of working plumbers whom I chanced to meet, but they merely indicated to me the district as being within their own knowledge, a bad one. As to bad cisterns, said the men, there would be no difficulty in finding as many as I wanted. They were pretty constantly coming across them. Who was to blame for them? Well, it wasn't easy to say. Sometimes the landlords and sometimes the tenants, and most always the sanitary inspectors. A landlord, perhaps, put up a cistern with a good lid to it and took no more trouble about it. After a bit the lid got rotten, and the tenant would break it up for firewood and then 'twas—perhaps just close to some factory with soot and smoke and fumes all beating down into it. The "young 'uns" would throw things into it, and the sediment would get thick at the bottom, and green slim would begin to grow in it, and it would soon be full of little live things—aye, and dead ones too. "I pulled a dead cat out of the cistern the other day where a whole houseful o' people had been drinking the water," said one of the men, and the rats and mice and dead birds and old boots and rotten rags were among the objects which, in the course of my inquiries, I had mentioned to me as having been found in neglected water cisterns."

Correspondence.

AN EXPLANATION,

ALBANY, N. Y., *Jan.* 13, 1883.

To the Editor of THE SANITARY ENGINEER:

In your issue before last there is a reference to a paper read by me before the Troy, N. Y., Scientific Association, in which you take exception to the following paragraph, while approving the rest: "Finally, we are prepared to say that in a house plumbed in accordance with the requirments of sanitary science, scarlet fever, typhoid, diphtheria, meningitis, etc., will not originate, while they are certainly invited by the absence of such precautions." Your criticism is that correct plumbing, *per se*, is not sufficient to prevent the occurrence of the diseases named, since there are other avenues of attack; as, for example, matters connected with ventilation. Further, the reviewer takes extraordinary pains to impute forced meanings to the word "originate," while avoiding its real, and it seemed to me, obvious meaning. The lecture was wholly devoted to matters of house drainage, everything else being expressly set apart for another occasion; this fact being included in the printed report reviewed. Then, because the germs giving rise to, or necessarily associated with, the diseases named, are discharged into the street sewers from houses where the diseases exist, and because the house drains are merely lateral prolongations of the sewers, it follows that if the plumbing in any house be defective there is chance for these germs, or some of them, to enter that house and cause the corresponding malady. In this sense, then, *as far as the drainage* is concerned, my statement is true and valuable, for there is no other way of accounting for the appearance of the disease, unless one is willing to accept the *de novo* theory referred to by the reviewer. Respectfully,

RICHARD PRESCOTT, Sanitary Engineer.

TRAPS AND DISEASE GERMS.

To the Editor of THE SANITARY ENGINEER:

The important paper of Dr. Carmichael of Glasgow seems to prove that the germs of disease (bacteria or their spores, or, indeed, any *particulate* matter) are unable to pass through a water seal, provided the seal be maintained against evaporation, syphonage, or other destroying influences; and provided the water be kept free from disturbance so that the germs or particulate matter cannot be washed up above the water level and escape when dried on the surface of the trap, and provided, finally, they be not forced through the water in bubbles of air.

I find, however, no record of experiments made in this direction, by other authorities, to corroborate the results of Carmichael, though I have made diligent inquiry among medical men. These appear to have studied the germ theory rather from a surgical and medicinal standpoint, than from that of its relation to sanitary plumbing.

Will you please inform me what books I can consult on the subject of the bacteria in this connection? and especially state what experiments have been made to support the views of Carmichael? Oblige, yours respectfully,

SUBSCRIBER.

[The results obtained by Dr. Carmichael are sustained by the experiments of Dr. A. Wernich, of Berlin, reported in a paper entitled "Die Luft als Trägerin Entwicklungsfähiger Keime," which was published in the *Archiv f. Path. Anat. u Physiol.*, Berlin, 1880, Vol. 79, p. 424, and also reported in a different form in No. 179 of the *Sammlung Klinischer Vorträge*, edited by Volkmann and published at Leipzic in 1880, with the title "Ueber verdorbene Luft in Krankenraümen."

A brief summary of the results obtained by Dr. Wernich is given in the number of this journal for May 1, 1880, page 210.

The results of Carmichael and Wernich were still further confirmed by the results obtained in the very careful and extensive series of investigations made for the National Board of Health, under the direction of Prof. Raphael Pumpelly, of the U. S. Geological Survey, and reported in Supplement No. 13 of the National Board of Health Bulletin, dated April 16, 1881. On page 22 of this Supplement it is stated as the result of the series of experiments detailed that "*At normal summer temperatures no germs were given off from the decomposing liquids whenever their surfaces remain unbroken, even though in some of the experiments the air was continuously conducted over them in a slow current. When the surfaces of the liquids were broken, however, by the bursting of bubbles, germs were invariably given off and the sterilized infusions infected.*" It is a question whether at higher temperatures germs may not be given off from putrefying liquids.

Miguel, in the *Annuaire Meteorologique de Montsouris* for 1878, page 540, says that in the evaporation of putrid liquids at temperatures of 104°–112° F. germs are given off, but this is yet doubtful, and such results are probably due to the drying of a film at the edge of the liquid and the subsequent detachment of fragments of this film by the air current. Such high temperatures are, however, never observed in sewer air.

While it would, perhaps, be theoretically possible to prevent the entrance of germs into a house or room by making it air-tight, filtering all the air entering it, and, in short, treating it like one of Pasteur's culture flasks, it is, of course, practically out of the question to obtain such results in our dwellings. It is very certain that a great majority of the germs of disease must rapidly lose their powers on exposure to light and air; this is shown by the results obtained by isolation of cases of contagious disease, and by the fact that scarlet fever, typhoid fever, small-pox, measles, etc., are very rarely communicated, unless the person catching them has been in the immediate vicinity of persons suffering from the disease or of infected articles.

When we have secured a proper system of drainage for a house we have cut off one possible source of the development or entrance of these germs, and the thing that we aim at for this purpose is to secure a constant current of fresh air through every part of the soil and drain pipes—in other words, to avoid dead ends as far as possible—to prevent the loss of the water seal in our traps by evaporation, syphonage, etc., and to prevent variations in pressure in the air of the sewers from affecting the air in the soil pipes.

It is true that the probability of the causation of serious disease by sewer air in a badly drained house is small, but it is sufficiently possible to warrant our taking precautions against it; and the fact that the great part of the disease and deaths in cities is due to other causes than sewer air, and will, therefore, not be influenced by improvements in house plumbing, is no reason why we should not prevent the small portion which can be thus influenced]

DETECTING IMPURITIES IN THE AIR.

ASBURY PARK, *Dec.* 30, 1882.

To the Editor of THE SANITARY ENGINEER:

Will you have the goodness to inform school teachers, through THE SANITARY ENGINEER, what are the handy methods by which the presence of carbonic oxide and excess of carbonic acid, and other dangerous gases can be detected by non-experts. It seems to me that if teachers were informed how they can learn whether ventilation is sufficient or not, they would (in most cases) be disposed to apply the tests, and regulate the air supply to meet the need. Respectfully, E. R.

[The simplest method of testing the sufficiency of ventilation in a school-room is by the use of lime water. The lime water should be fresh made at intervals of three or four weeks by shaking slacked lime with distilled water, allowing it to settle, and drawing off the clear liquid; or it can be purchased of an apothecary. Procure five bottles with smooth, tight-fitting corks, one containing 20.6 fluid ounces, and the others containing respectively, 10.5, 8, and 6.5 fluid ounces. Obtain also a small bellows or hand-ball syringe, with about a foot of rubber tubing filled to its nozzle. Commence with the bottle which holds 8 fluid ounces and fill it with air in that part of the room which you wish to test by removing the cork and inserting the rubber tube until its end is near the bottom of the bottle, and then working the bellows to pump the air into it. Do this in such a way as to get a fair sample, taking care that neither your own breath nor that of others is pumped in undiluted. Having secured the sample, pour into the bottle half an ounce of lime water, cork, and shake thoroughly and allow it to stand for five minutes. If you then find that the lime water has become perceptibly turbid, as if a little milk had been dropped in it, you may be sure that the proportion of carbonic acid present is 8 or more parts in 10,000, and that the ventilation is insufficient. In this case repeat the experiment with the bottle containing 6.5 ounces; if the same quantity of lime water in this bottle is also rendered turbid, the proportion of carbonic acid is 10 or more parts in 10,000, and the ventilation is decidedly bad. If, on the other hand, the lime water is not rendered turbid in the 8 ounce bottle, test by the same quantity in the bottle holding 10.5 ounces. If this is not made turbid, the quantity of carbonic acid present is less than 6 parts per 10,000, and the ventilation is certainly sufficient. The largest bottle, containing 20.6 fluid ounces, is to test the proportion of carbonic acid in the external air. Usually when half an ounce of lime water is shaken in a bottle of this size containing air collected in the street, it will show a slight turbidity, indicating the presence of carbonic acid in the proportion of about 3 parts in 10,000.

Simple as this testing is, it requires care and attention to details. The bottles must be thoroughly cleansed and dried after each experiment, and the lime water must be fresh. Two hours' practical instruction by a chemist in the details of manipulation would be worth more to you than a volume of description. The following is a part of a table given by Dr. Smart, to show the amount of carbonic acid indicated by bottles of various sizes used as above described.]

VENTS CAST WITH TRAPS.

NEW YORK, *Jan.* 16, 1883.

To the Editor of THE SANITARY ENGINEER:

Why do not the dealers in or makers of lead 1¼", 1½", and 2", cast traps now cast upon the crown of each, a 2" branch to which the branch vent-pipes for ordinary houses could be attached by a wiped joint?

In that way a much better and cheaper job could be made by the plumber than the present method of drilling a hole in the crown, and making an irregular wiped joint. Could you not suggest it. Yours, etc.,

WALTER G. ELLIOT, PH.D.

[There probably has been no demand for them. This suggestion was made by Mr. Samuel Crump, in these columns, page 522, Vol. V. We presume that plumbers do not consider that much labor would be saved. Moreover, it is impracticable to attach the air vents at exactly the same point every time. This is a matter in which we should like the opinions of practical plumbers.]

SHONE SYSTEM OF SEWERAGE.

SACRAMENTO, *Dec.* 26, 1882.

To the Editor of THE SANITARY ENGINEER:

Some time ago I received a pamphlet containing an exposition of the Shone system of sewerage from you, and I wish to make the following inquiries, which you may answer through the columns of your paper, or privately, if you wish, viz.:

1st. Has the Shone system been applied to the drainage of any town as yet, and, if so, with what success?

2d. Do you consider that the use of compressed air, as described by Isaac Shone, would work satisfactorily and economically?

3d. Do you think that the automatic and other mechanical arrangements of his ejectors would work satisfactorily?

Our city is much in need of improvements in its sewerage system, and I am engaged in collecting the necessary data for determining what plan it is best to fix upon.

Our city is located upon a level plain, with poor drainage outlets; I am satisfied that if the working of the Shone system is satisfactory, it is the best system for our location.

Any information you can give, or any sources of information you can refer me to, will be thankfully received.

Very respectfully, L. F. BASSETT.

[The Shone system was reviewed at length on pages 60 and 61, Vol. IV., Jan. 1, 1881. We have never sent a

Digitized by Google

pamphlet of the Shone or any other system to our correspondent, though it is possible he may have purchased some book from the Book Department of this journal.

The Shone system has been applied at Eastbourne, a watering place on the south coast of England, and, we understand, satisfactorily.

The economy of using compressed air for the purpose proposed depends on local circumstances. When these circumstances are fully comprehended by a competent engineer, he can determine whether it would be better and more economical to rely on pumps, or apply compressed air to move sewage. No general answer can be given. Our correspondent will find the use of air as a motive power discussed by Prof. Henry Robinson at page 157, issue of THE SANITARY ENGINEER of March 1, 1881.

Messrs. Spon have published two books for the Shone Company—one a pamphlet at 60 cents, the other a plan proposed for the city of Portsmouth, England, at $4.20. Either can be obtained of the Book Department of THE SANITARY ENGINEER.]

NOISE IN BASIN WASTE.

WOBURN, MASS., *Jan.* 8, 1882.

To the Editor of THE SANITARY ENGINEER:

I write to you about a trouble with a waste pipe I was called to look at. I will draw it out on the other side of this sheet.

There are two basins with outlets very near together, and no traps under either one, but a trap in the cellar; when they draw a bowl of water it makes a noise like thunder. I wanted to take out the lead pipe and put in 2-inch soil pipe and run it through the roof, but the man thought it would not do, so I put a round trap in and ran the wastes from each basin into it (the trap is at the point where the branches from each basin join the vertical pipe). It makes as much noise as ever. I would like your opinion.

The people here have a plan of putting the traps in the cellar, so they will not freeze, and others will have no trap at all. How can I teach them common sense?

Yours truly, T. H.

[Your waste pipe is probably small, and the noise is caused by the sucking in of air at one bowl while a pipe full of water is being discharged from the other.

No such arrangement as you show should be in any house. The waste pipe should extend through the roof, each basin should have a trap close under it, and not at the bottom of the line. If you read THE SANITARY ENGINEER you can see in almost every issue the proper way to connect basins to a waste pipe and to trap them.]

Mr. L. O. Howell by way of explanation of the use of the name of THE SANITARY ENGINEER in his advertisement writes us: "In regard to your endorsement on all my cards and letter headings, I distinctly say Sanitary Engineers. The paper you have with the words 'Engineer' is a small paper published in the north western part of the city, and in copying has made a mistake which I cannot help."

WINTER BATH HOUSES FOR THE POOR.

We fully agree with the *Commercial Advertiser* in its demands for bath houses for the poor, but there are much weightier reasons for public baths, than for soup houses. The necessity for the latter we very much doubt.

The *Advertiser* says:

"If there is one thing more than another from which poor people suffer at this season it is the need of a bath, or facilities for washing. The diseases which destroy life in tenement houses would not crop out and spread could occupants have an opportunity of bathing. All summer long, when free salt water baths are open, those who live in crowded apartments bathe and keep well. Now, a trip through the abodes of the poor will satisfy any one of the miserable condition of some member of nearly every family. Rheumatism, fever, "malaria," or any of the maladies consequent upon impoverished blood, resulting from a skin stifled by impurities, are sadly prevalent. Bath houses for the poor in winter are as necessary as soup houses. The Board of Charities would save expense by providing these, when pest houses and hospitals would have fewer occupants. Give the poor a chance to keep clean, and we will have fewer vagrants, tramps, and criminals."

CHICAGO MASTER PLUMBERS.

(From our Special Correspondent.)

CHICAGO, *Jan.* 18, 1883.

The modest Fairbank hall in Central Music Hall building was quite filled this evening on invitation of the Master Plumbers' Association, the occasion being the first of a series of lectures under their auspices on practical sanitary subjects. Mr. Andrew Young, Corresponding Secretary, introduced the speaker, saying:

"Ladies and gentlemen, on behalf of the Plumbers' Association I bid you welcome to this our first lecture on sanitation. The attendance here to-night shows that the interest in this subject is felt pretty thoroughly. It is the intention of our association to have public lectures from time to time on sanitary subjects, a course that will benefit ourselves and strengthen the hands of our Health Department. I now have the pleasure of introducing to you Prof. A. Reeves Jackson."

The lecturer, in beginning, expressed his gratification at seeing present so many plumbers and so many plumbers' helpers. "I think it is the first time that I have ever seen the plumber and his helper when I had a degree of pleasure indeed. Until quite recently I have had the impression that a plumber was the natural enemy of mankind, and that his work was entirely at fault and in opposition to that of the doctor; that while the aim of the doctor was to dose, that of the plumber was to bewilder and destroy. I have thought that there was but a single thing in common between the two; namely, that both when they had made a mistake, had done a bad piece of work, were anxious to have it hid from the eyes of the world as quickly as possible, the plumber to do this having at his command lath and plaster and the doctor six feet of earth. As for the helper, I have regarded him simply as a fiend, worse only, if possible, than the plumber himself. But I am a changed, a converted man. I have learned to know the plumber as he is, and to know the helper as *she* is, and henceforth I am on the side of the plumber, and the more ladies he has the more I am on his side.

"But I didn't come here to-night to lecture on Sanitation. I come before you simply to apologize, and I am not quite sure but that, as I am not going to lecture, it is right and proper that you should know why. One week ago a committee of one of your number came to me and said, 'we are an abused class; the public don't understand us and our high aims; the public think that the only high things about us are our charges; they think that we are not human, that we are only plumbers, that we are men and being plumbers we have an association. Don't attempt to instruct us. The members of that association have too much knowledge already and they don't want any more. They are discouraged at their position and they want encouragement, they are sad and want something entertaining.' I should have been proud to talk about the Board of Health, the principles of sanitary science, small-pox, house drainage, bacteria and all that, but you would not have it so, immensely valuable as the information would have been."

Following Dr. Jackson, Professor J. J. M. Angier, of the College of Physicians and Surgeons, gave a talk on sanitation, replete with good points.

COMPLAINT AGAINST UNDERGROUND STEAM PIPE.

The occupants of a number of buildings on William St. between Cedar and Pine recently complained to the Board of Health of offensive odors believed to be due to the underground pipes of the American Steam Heating and Power Co. An inspection was made by the Board and the report presented at the meeting last week. The odor in some places seemed to the inspector to be clearly caused by gas escaping from a leaky main. In other places a tarry odor prevailed which he believed came from creosoted planks surrounding the steam pipes and probably due to a slight leak.

The Board took no action on the matter. A more complete investigation is to be made, we understand, before any decisive action is taken.

A smoke consumer invented by the Superintendent of the Excelsior Manufacturing Co., of St. Louis, is described by the *Age of Steel*. A draft of air is admitted through the ash pit and upwards through a hollow bridge wall, and passes through a perforated cast iron top piece. A 2-inch gas pipe, running crosswise the boiler, is set in the lining just above the fire door. The pipe has a row of ⅛-inch holes drilled about an inch apart, so set that the draft of air passing from the holes will strike about half-way between the grate bars and the top of the bridge wall. On the outside of the side wall is fastened on, to the end of the 2-inch gas pipe, a funnel-shaped piece of tin. From the steam drum there extends a ½-inch steam pipe, with a stop valve, to the funnel-shaped piece of tin and into the two-inch pipe two or three inches. When the steam is turned on it creates a strong draft of air through the funnel-shaped piece of tin into the 2-inch pipe, from which it passes into the fire bed through the perforated pipe.

The western end of the island of Montreal has been suffering greatly from the failure of springs which have furnished plenty of water heretofore.

The mine water in the Pennsylvania coal regions is so strongly impregnated with sulphur and filled with coal dust as to render the water of the Schuylkill into which it flows, unfit for domestic use or for steam boilers. The Philadelphia *Press* states that at Gilberton, near Pottsville, the water needed for boilers is purified by the following process. It is first pumped into large tanks and a certain quantity of lime is sprinkled on the surface. In an hour and a half it has become perfectly clear. Before using, it is tested with lithmus paper, for the presence of too much sulphur or a surplus of lime, and if not suitable is further treated. When in a satisfactory condition, it is drawn off for use and the tanks cleaned of their deposit and re-filled again. The expense of this operation is much less than that of procuring water from a distance.

Philadelphia water was bad the other day. The chief of the Water Department attributed it to the freezing over of the Schuylkill and the consequent impossibility of proper aëration. The Water Committee requested the Fairmount Park Commissioners to cut and remove the ice on the river.

The Illinois Tilemaker's Association had an interesting convention at Springfield, on Jan. 16-17, and discussed practical questions relating to the manufacture and use of drain tiles. We have frequently spoken with commendation of the meeting of persons engaged in the same business, at stated times, for an interchange of ideas. Much good must result from it. There are always some persons present, of course, who only desire to ride their own hobbies, but it is generally found that the common sense of the great majority of the members is proof against their attacks.

The Schuylkill river continues offensive to taste and smell, and no one in Philadelphia has been able to account for it satisfactorily or to suggest a remedy. Coal tar has its uses and advantages, but the human palate has not yet been educated up to the point of recognizing it as a pleasing beverage. The commission of experts, appointed by the Mayor to investigate the present and future water supply, have collected samples of the water, but there is no appropriation to make analyses. But there have been any number of amateur analyses made with the usual result of discovering what every one knew, that the water is bad, but no one knows exactly why it should be so much worse now than at any other time.

A magistrate at Paterson, N. J., administered an oath by telephone the other day.

Small-pox has broken out in a lumbering camp in Northwestern Canada.

Between May 1, and November 30, 1882, 1,644½ miles of streets was swept in Chicago; an average of 235 miles per month.

AMERICAN SOCIETY OF CIVIL ENGINEERS.

The annual meeting of the above organization was held at the Society's rooms, 127 East 23d st., on Wednesday of last week. About fifty members, or less than one-tenth the whole number, were present. The following are the newly elected officers of the society: Charles Paine, President; W. H. Paine and Henry Flad, Vice-presidents; John Bogart, Secretary and Librarian; J. J. R. Croes, Treasurer; and G. S. Green, Jr., J. P. Davis, William Metcalf, W. E. Merrill and W. G. Hamilton, Directors. The "Norman" medal for the last year was awarded to A. Fteley and F. P. Stearns, of Boston, for a joint paper on "The Flow of the Water of Sudbury River." An amendment to the constitution providing for the formation of branch sections was unanimously recommended for adoption by letter ballot. The proposed amendment permits the Board of Directors to consider, and a two-third vote of the society to grant, an application of ten or more members to form a local section in any place for the convenience of those living too far away to attend the New York meetings. Those not members of the society may (if the amendment be adopted) attend the meetings of the branch sections and take part in the discussions, which may be published in the proceedings of the society. The special committee on uniform standard time approved the action of Congress in authorizing the President to call an International Congress to consider the subject, and recommended the calling of a convention as soon as possible to determine upon a standard best adapted to the interests of North America.

The greater part of the next day, Thursday, was devoted to an excursion to various objects of engineering interest in the city and vicinity. In the morning a navy yard tug, placed at their disposal by Com. Upshar, took the party to the Erie Basin, where an hour was spent in the inspection of the great dry docks, under the guidance of Messrs. J. E. Simpson and Sons, the builders, and M. M. Tidd and F. C. Prindle, members of the society and engineers of the pumping machinery. Returning by the tug to the Brooklyn wharf of the East River Bridge, that structure was inspected, a portion of the party crossing the river span after examining the Brooklyn approach, and the remainder crossing in the tug. The footway which was to have been completed on the 15th, was delayed by the non-arrival of a ship load of plank, and those who crossed, did so on the narrow path of loose plank used by the workmen. The party was accompanied by the engineers connected with the construction of the bridge, Messrs. Collingwood, Martin and Paine, who explained the chief feature of interest in the more recently erected parts. Mr. Paine exhibited a micrometer used in determining stresses in truss-ties at those places where the stresses are irregular and difficult or impossible to determine by analysis. It consists of a bar of steel ten feet long and about one and one-half inches wide and one-eighth inch thick, with a micrometer attachment at one end reading to one-millionth of the length of the bar. Screws ten feet apart are inserted in every diagonal where the stresses are irregular and the measuring bar inserted between their projecting ends. The stresses produced in the bar under various portions of the load, are calculated from its change in length. The screws are left in the bars and protected from corrosion and other injury by putty and paint.

After lunch at Delmonico's, the party proceded to the Mills' building, where they were met by the architect, Mr. Geo. B. Post, who first explained to them the peculiar difficulties under which the building was erected, and then exhibited the very interesting method he had adopted of supplementary foundations and other peculiar features of the structure.

Station B, of the New York Steam Heating Company, was the next and last place visited. A model had been prepared showing the method of laying the pipes under ground and by reference to it together with maps and plans and the works in sight, Mr. C. E. Ennery, the engineer-in-chief, explained very fully the gigantic scheme, of which our readers will find a description in this number of THE SANITARY ENGINEER.

In the evening a reception was held in the house of the society, at which over 100 members and invited guests were present.

THE ENGINEERS' CLUB OF PHILADELPHIA.

The fifth annual meeting of the Engineers' Club, of Philadelphia, was held the 13th inst. The annual address by the retiring president, Mr. Rudolph Hering, was a review of the progress of engineering. He closed with recording the advance in the different branches of city engineering, which includes water and gas supply, the furnishing of steam for heat and power, of electricity for light and power, the removal of waste matters, and the paving of streets.

Mr. G. S. Strong presented a description with illustrations of his new design for express locomotives.

The officers for 1883 are as follows: President, Henry G. Morris; Vice-President, William A. Ingham; Secretary and Treasurer, Howard Murphy; Directors, T. M. Cleemann, Frederic Graff, Rudolph Hering, Strickland Kneass, and Percival Roberts, Jr.

BROOKLYN WATER PURVEYOR'S REPORT.

By the courtesy of Mr. Milne, Water Purveyor of Brooklyn, we are enabled to present to our readers this week his Annual Report to the Commissioner of the Department of City Works. His statements and views on the subject of Water Waste are especially timely and valuable. The report given below is complete, with the exception of the tables and statements of the work done by the Department during the year.

BROOKLYN, *Jan.* 8, 1883.

HON. RIPLEY ROPES, *Commissioner Dep't City Works:*

SIR:—I herewith submit the Annual Report of the Purveyor's Bureau for the year 1882.

The records of the Chief Engineer's Bureau show a daily average increased consumption of water for the year 1882 over the year 1881 of 1,891,091 gallons, as herewith shown:

Average daily consumption year	1882,	34,622,590	gallons.
" " "	1881,	32,731,499	"
Average daily increase "	1882,	1,891,091	"

The records of the Meter Department indicate a consumption of water as registered by meters of 1,460,044,001 gallons for the year 1882, and shows an increase over year 1881 of 164,086,863 gallons, as herewith shown:

For year 1882	1,460,044,001	gallons.
" 1881	1,295,957,138	"
Increase for year 1882	164,086,863	"

The daily average consumption per capita for year 1881 was	58.44
The daily average consumption per capita for year 1882 is	58.22
Showing a difference in favor of 1882	.22

The average daily consumption of metered water per capita is 6.72 gallons, leaving 51.20 gallons for all other purposes, including domestic use, fire purposes, flushing sewers, street washers, street sprinklers, public fountains, drinking hydrants, bar rooms, horse troughs, water for shipping, tug boats, private stables, leaks in water mains, and all other uses not determined by meter measurement. Making a liberal allowance for each item above mentioned, the factor 15 appears, which I am compelled to charge to account of *waste*, as follows:

Average daily consumption per capita		58.22 galls.
Average daily consumption per capita determ'd by meter.	6.72 galls.	
Purposes enumerated above	36.50 "	
Waste	15	58.22 galls.

The estimated daily waste per capita is 25.76 per cent. of the daily consumption, and it is the minimum figure compared to data usually applied to the item of waste in City Water Works.

I have in previous reports expressed my views concerning this important question and can only supplement them by stating that my experience during the past year adds emphasis to the already expressed opinion, that radical measures must be enforced to effectually check waste of water, *nearly* 9,000,000 *gallons being wasted daily.*

It is a subject with which the people should be made thoroughly familiar, in order to prepare them for the consideration of questions which will inevitably force themselves upon our notice. I am aware that it is not an easy task to attempt to educate public sentiment to a point where it will look favorably upon a restricted supply of water, especially after an experience of 23 years of lavish and wasteful use of it. Measures should, however, be adopted compelling the use of water-saving devices on all premises.

Another feature of waste of water is manifest in the manner in which plumbing work is constructed without regard to the question of pipes being affected by *frost*; owners of all premises should be compelled to so construct plumbing work as to be absolutely frost-proof.

The adoption of stringent rules and regulations for the carrying out of these suggestions will go far toward reducing waste of water. Should house owners then pay no attention to the efforts of the Department in suppressing waste, and still be indifferent to the vital interests of a city of 600,000 people, all dependent upon its water supply, they should then be promptly and rigidly dealt with, and water cut off from premises or a meter applied to the service-pipe, thereby compelling the payment for all water consumed in excess of the amount to which they may be entitled, in consideration of the payment of Water Rates.

The work of the Inspectors of Plumbing develops a large amount of defective plumbing work, the owners of which are not likely to cause repairs to be made, unless the waste of water causes them personal inconvenience. Many devices used by plumbers for the distribution of water in dwellings are wasteful in character, and others have become so by reason of faulty construction, hence it is necessary for inspectors to repeat their visits frequently.

METERS.

During the past year 292 meters have been set upon service-pipes supplying water for manufacturing purposes, restaurants, bar-rooms, stables, railroad watering stations, large apartment dwellings, and large private residences, and also upon a number of buildings used for office purposes. The general condition of meters now in service is better than formerly, the meter accounts are very satisfactory, testifying to increased care on the part of those having charge of them.

There are many details in connection with the work of setting and maintenance of meters. By referring to the accompanying tables, a better idea of its character may be obtained.

FIRE HYDRANTS.

The new plan for the inspection and repair of fire hydrants has been attended with success. It is a decided improvement in the saving of time and money. Heretofore men were employed as Inspectors who simply reported their condition; if the hydrants were found leaking at their waste during freezing weather, it was their duty to pump them out, but any repairs required were reported at the Repair Yard. Now a horse and wagon is employed and a machinist and helper, equipped with requisite tools and fixtures, make the daily rounds inspecting and repairing, reporting daily the condition of hydrants. This change is for the better, and is a step in the way of increased efficiency and in addition thereto, will effect a saving of $6,554 over the old plan, per annum.

RE-SURVEY OF PIPE DISTRICT.

This branch of the service during the year 1882 has been an advantage to the City, resulting in an increase of permanent revenue amounting to $7,297.18 to May 1st, 1882. Since which date 103 streets and avenues have been surveyed; during the year 104 buildings were deprived of water in consequence of non-payment of extra water rates, together with expenses and fines attending the cutting off of water.

DRINKING HYDRANTS.

The drinking hydrants of the entire city have been inspected regarding their use, and reports of the Inspector employed for that purpose have furnished information which has satisfied us in shutting off supply water to many of them, and as soon as the weather permits, such of those which are not required for legitimate use will be removed.

Respectfully submitted,

PETER MILNE, JR.,
Water Purveyor.

Complaint is made of the condition of the sewerage system in the vicinity of the gulf in East Utica, which it is said doubled the usual amount of sickness.

A disease somewhat resembling cholera morbus has attacked a large number of the residents of North Rose and vicinity. It is doubtless caused by the use of the first water that comes into wells that have been dry a long time. All of the cases readily responded to prompt treatment and terminated favorably.—*Rochester Democrat.*

There is a great scarcity of water in the Eastern States, and many mills run by water-power have been obliged to shut down for want of supply, thus throwing large numbers of operatives out of employment.

POWER OF A STATE BOARD OF HEALTH TO LEVY A QUARANTINE TAX.

The following is the text of Judge F. A. Monroe's decision reprinted from the New Orleans *Times-Democrat* in the case of Morgan's Louisiana and Texas Railroad and Steamship company, against the Board of Health of the State of Louisiana, denying the right of the latter to levy a quarantine tax.

Plaintiff owns a number of steamships which are engaged in the business of commerce between the port of New Orleans and various other ports in the United States and elsewhere.

Under the quarantine laws of this State, each of these ships entering the port of New Orleans through the mouth of the Mississippi river is required to report at the quarantine station, established by the State authorities at the latter point, for the purposes of inspection and, if necessary, of disinfection.

When the ship hails from a port in which yellow fever does not usually prevail, and in which no contagious or infectious disease is reputed to exist, and has not touched at any such port, and has not come in contact with any vessel having any contagious or infectious disease on board, and there is no contagious or infectious disease actually on board of such ship, and she is not in a foul condition, the master, upon payment of the sum of thirty dollars, is furnished by the health officer at the station in question with a "permit" to proceed with his ship to the city of New Orleans.

When, however, the ship comes from a port in which yellow fever usually prevails, or in which some contagious or infectious disease is reported to exist, or has touched at such port, or has come in contact with some vessel having such disease on board, or actually has such disease on board, or is in a foul condition, she is detained at the station and subjected to a process of disinfection by fumigation and other methods, after which and upon payment of the $30 mentioned above as the charge for inspection, and of an additional sum of from $20 to $25 as the charge for disinfection, the "permit" or certificate is given and the ship is allowed to enter the port.

The particular statute under which the fee or charge of $30 is exacted is the Act No. 69, of 1882, which reads as follows:

"SECTION 1. *Be it enacted, etc.*, That the resident physician at the Quarantine Station on the Mississippi river shall require for every inspection and granting certificate, the following fees and charges: For every ship thirty ($30) dollars; for every bark twenty ($20) dollars; for every brig, ten ($10) dollars; for every schooner, seven dollars and fifty cents, ($7 50), for every steamboat (towboats excepted) five ($5) dollars; for every steamship, thirty ($30) dollars.

"SECTION 2. That the Board of Health shall have an especial lien and privilege on the vessels so inspected for the amount of said fees and charges, and may collect the same, if unpaid, by suit before any court or competent jurisdiction, and in aid thereof shall be entitled to the writ of provisional seizure on said vessels."

By virtue of other provisions of law, which it is unnecessary to quote, the Board of Health requires the payment of $20 or $25 additional as the cost of disinfection when such treatment is considered necessary.

The effect of the present suit is to perpetually enjoin the collection of these charges, and to restrain the Board of Health from detaining the plaintiff's vessels because of their nonpayment, or from enforcing the quarantine regulations as against said vessels in a more oppressive manner than against others.

The plaintiff alleges that the laws relied on, in so far as they purport to authorize the exaction of the fees and charges in question, are null and void, in that they contravene—

1. Article 1, section 8, paragraph 3, of the Constitution of the United States, which provides that:

Congress shall have power * * * * to regulate commerce with foreign nations, and among the several States and with the Indian tribes.

2. Article 1, section 10, paragraph 3, which provides that: "No State shall, without the consent of Congress, lay any duty of tonnage."

3. Article 1, section 9, paragraph 6, which provides that "No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another, nor shall vessels bound to or from one State be obliged to enter, clear or pay duties in another."

It is remarkable that in view of the fact that the convention which adopted the Constitution of the United States distinctly determined, after the most elaborate and earnest discussion, that the States should not be allowed, without the consent of Congress, to levy duties of tonnage for any purpose whatever; that it should still be considered a subject for discussion as to whether such duties may not be imposed for the support of a police or quarantine regulation established by a State for the protection of the health of its citizens.

In order to show how clearly this whole subject was placed before the convention, I quote the following passage from the "History of the Constitution of the United States," by Judge Curtis, vol. 2, p. 370. He says:

"In order to vest the supervision and control of the whole subject in Congress, it has further provided that no State, without the consent of Congress, shall levy any duty of tonnage. An exception proposed by some of the Maryland and Virginia members (of the convention which adopted the constitution), with a view to the situation of the Chesapeake bay, illustrates the object of this provision. They desired that the States might not be restrained from laying duties of tonnage 'for the purpose of clearing harbors and erecting light-houses.' It was, perhaps, capable of being constructed that, as the regulation of commerce was already agreed to be vested in the general government, the States were restrained by that provision from laying tonnage duties. The object of the special restriction was to make this point entirely certain; and the object of the proposed exception was to divide the commercial power, and 'to give the States concurrent authority to regulate commerce for a particular purpose. But a majority of the States considered the regulation of tonnage an essential point of the regulation of trade. They adopted the suggestion of Mr. Madison, that the regulation of commerce was in its nature indivisible and ought to be wholly under one authority. The exception was accordingly repealed.'"

It was certainly capable of being constucted with great force of reason, with reference to the particular exception proposed in the convention—that the clearing of harbors and the erection of light-houses might be regarded as a service rendered to commerce, and that in paying therefor the commerce of the country would merely pay for service rendered.

The conclusion of the convention, however, appears to have been that the power to impose compulsory charges or exactions for any purpose, or upon any pretext, involved the power to regulate commerce, and that the power ought to be vested in the general government and be undivided.

They, therefore, refused, as we have seen, to adopt into the Constitution an exception permitting the States to lay a duty of tonnage to clear harbors and erect light houses.

They did, however, adopt a provision which has the appearance of an exception to the clause vesting in Congress the power to regulate commerce; I refer to paragraph 2, section 10, article 1, which provides that—

"No State shall, without the consent of Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws, and the net produce of all duties and imposts laid by any State on any imports or exports, shall be for the use of the Treasury of the United States, and all such laws shall be subject to the revision and control of the Congress."

It is conceded that the inspection laws thus referred to are such laws as may be enacted for the inspection of merchandise, and that the imposts or duties in question are such as may be imposed upon merchandise.

This exception, therefore, in no way, affects the prohibition contained in the very next paragraph of the same article, to the effect that "no State shall, without the consent of Congress lay any duty of tonnage," since the duty of tonnage is levied upon the ship, and is not an impost or duty upon merchandise imported or exported. The exception is attached to the prohibition to which it relates whilst the prohibition against the levying of duties of tonnage stands alone and without the exception, nor can this exception be held to affect the power of Congress to regulate commerce.

In Gibson *vs.* Ogden, 9 Wheat, 205, the Supreme Court said:

"The object of the inspection laws is to improve the quality of articles produced by the labor of the country, to fit them for exportation, or it may be for domestic use. They act upon the subject before it becomes an article of foreign commerce, or of commerce among the States, and prepare it for that purpose."

So in the case of Brown *vs.* Maryland, 12 Wheaton, 420, it was said:

"The tax or duty of inspection is frequently, if not always, paid while the article is in the bosom of the country."

* * The exception was made because the tax would otherwise have been the prohibition.

Considering the language last above quoted, it occurs to the mind at once that even if this exception should have the effect of leaving with the States the power to regulate commerce for the purposes of the inspection of merchandise, this results solely from the fact that said exception is embodied in the Constitution, but when we further consider the limitations to which the exception is subject, it becomes more and more manifest that it can have no such effect; since, in the first place, it is provided that the net revenue of all such imposts shall be for the use of the United States Treasury, thus confining the interests of the State in the matter to the actual cost of inspection, and guarding against the use of the power referred to as a means of regulating commerce; and, in the next place, it is provided that "all such laws shall be subject to the revision and control of the Congress," or that if perchance, inspection laws were used for the purpose of regulating commerce, Congress could at any time remedy the evil by proper legislation.

It may safely and properly be said, therefore, that there is not to be found upon the face of the Constitution a single exception to the rules; that Congress alone has the power to regulate commerce, and that the States, without the consent of Congress, have no power to levy duties of tonnage.

After the adoption of the Constitution, it being conceded that the States had not divested themselves of the power to establish and enforce their own health and police regulations, and there appearing a possibility that these regulations might interfere with, or be interfered with by the laws passed by Congress for the regulation of commerce, certain acts were passed by Congress, concerning which Chief Justice Marshall used the following language, to wit:

"The acts of Congress passed in 1796 and 1799, empowering and directing the officers of the general government to conform to and assist in the execution of the quarantine and health laws of a State, proceed, it is said, upon the idea that these laws are constitutional.

"It is undoubtedly true that they do proceed upon that idea, and the constitutionality of such laws has never, so far as we are informed, been denied.

"But they do not imply an acknowledgment that a State may rightfully regulate commerce with foreign nations or among the States; for they do not imply that such laws are an exercise of that power or enacted with a view to it.

"On the contrary, they are treated as quarantine and health laws, are so denominated in the acts of Congress, and are considered as flowing from the acknowledged power of a State to provide for the health of its citizens. That as it has appeared that some of the provisions made for that purpose and in virtue of this power might interfere with and be affected by the laws of the United States made for the regulation of commerce, Congress, in that spirit of harmony and conciliation which ought always to characterize governments standing in the relation which that of the Union and those of the States have to each other, has directed its officers to aid in the execution of these laws, and has, in some measure, adapted its own legislation to this object by making provisions in aid of those of the States. But in making those provisions the opinion is unequivocally manifested that Congress may control the State laws so far as it may be necessary to control them for the regulation of commerce." 9 Wheat., 205.

Referring to the act of 1799, mentioned in the foregoing opinion, we find that it contains the following section and proviso, to wit:

"The quarantine and other restraints which shall be required by the health laws of any State, or pursuant thereto, respecting any vessels arriving in or bound to any port or district thereof, whether from a foreign port or place, or from another district of the United States, shall be duly observed by the Collectors" (and other Federal officers).

* * * * * *

"*Provided*, That nothing herein contained shall enable any State to collect a duty of tonnage or impost without the consent of the Congress of the United States."

The insertion of the proviso was unnecessary perhaps, as the Constitution itself contains the same prohibition; but it may have been thought that the language of the act would be construed as implying the consent of Congress to the levying of tonnage to support quarantine, and the insertion of the proviso is significant as showing that Congress (at that time composed of men some of whom had framed the Constitution) entertained no doubt that whilst the State might, without the consent of Congress, enact and enforce their health laws, they could not levy duties of tonnage to defray the expense of the same.

It was also found upon the adoption of the Constitution that there was in force in every State a system for the regulation of pilotage, which system was adopted by Congress by act of August 7, 1789, and given the same validity as if its provisions had been specially enacted by Congress. If, therefore, any duty of tonnage for pilotage or half pilotage is collected, such collection is made with the consent of Congress.

Again, in many ports, wharves have been constructed either by private or municipal enterprise, and all vessels landing at such wharves are charged a certain amount—either so much per ton, or a fixed sum for vessels of a particular description—for the use of the wharves and the peculiar artificial facilities afforded by them upon precisely the same principle that charges are made by the proprietors of dry-docks for accommodations to vessels, except that the charge for wharfage upon the banks of navigable streams cannot exceed a reasonable compensation.

So, in the case of port wardens, if the master of a vessel permits them to render a service to his vessel, the port warden is entitled to his compensation. But I think it the correct principle, as stated by the learned counsel for plaintiff in his brief, that any charge imposed by the State upon a vessel engaged in commerce, for which no equivalent is given, is a duty of tonnage, whether such charge be measured by the tonnage of the vessel or imposed as a fixed sum upon all vessels of a particular character. And beyond this, I am satisfied that the States have no authority to impose upon vessels services which are neither needed, nor desired, and exact payment therefor of sums fixed by the States themselves.

In the case at bar, for instance, it appears from the testimony that the fumigation of a vessel for the purposes of disinfection destroys more or less of the roaches and other vermin by which ships are sometimes infected, and it may be said that the destruction of such vermin is advantageous to the ship, but it would be difficult to demonstrate upon what principle of law or common sense the State of Louisiana should be permitted, against the wishes of the owner, but at his expense, even to destroy vermin on his vessel, unless in furtherance of some police or health regulation; but the very basis of the power which the States possess, to adopt and enforce such regulation is the inherent and inalienable right of self-protection. And the basis of the argument of the defence in this case is that the State has exercised this power to establish quarantine for the protection of her citizens; neither the power, therefore, nor the manner of its exercise in this case, affords the shadow of a pretext for the claim that vessels quarantined against the wishes of the owner, are thereby rendered a service for which a sum of money arbitrarily fixed by the State, may be exacted.

Digitized by Google

The point upon which counsel for defendant appears to place most reliance is, that the charges which are here objected to are not duties of tonnage, because they are not proportioned to the tonnage of the vessel taxed, but are fixed with reference to the class or character of the vessels.

If as we have seen, no service is rendered to the vessel, there exists no basis for the charge, whether it be a duty of tonnage or not; but the proposition that a steamship of 3,000 tons can be forced to pay $30 toward the support of our health and quarantine system, provided the charge is imposed without the use of the word tonnage, and yet that nothing could be collected for so excellent a purpose if the charge is imposed at the rate of one per cent. per ton, it seems to me is disrespectful to the Constitution of the United States.

The same point, has however, been suggested before, and was thus disposed of by Chief Justice Chase: "It was not only a pro rata tax which was prohibited, but any duty on the ship, whether a fixed sum on its whole tonnage or a sum to be ascertained by comparing the amount of tonnage with the rate of duty." 6 Wallace, 33.

In this same case, in referring to the question of the right of the port warden to collect fees without the rendition of specific services, upon the theory that it was an advantage to commerce that such officers should be at hand, the court said:

"It may be true that the existence of such a body of men is beneficial to commerce, but the same is true of the government of the State, of the city government, of the courts, of the whole body of public functionaries. If the constitutionality of the charge for the benefit of the master and wardens, can be maintained upon the ground that it secures compensation for services it is difficult to perceive upon what ground the constitutionality of any State law imposing taxes for the benefit of the State government, upon vessels landing at its ports can be questioned." 6 Wall., 33. See also 12 Wall., 218; 20 Wall., 580; 31 Ann., p. 65; 34 Ann., 703.

An intervention was filed in this suit by the Attorney General, on behalf of the State, in which it is alleged that the plaintiff is seeking to have annulled laws "whereby revenues are raised and provided for the maintenance and support of the quarantine system and service of said State for the prevention of the introduction of contagious and infectious diseases into the State of Louisiana," etc., all of which is undoubtedly true, and exhibits sufficient interest on the part of the State to justify the intervention.

It also serves to illustrate more clearly the conflict between the laws referred to and the Constitution of the United States, since it is thus judiciously admitted and averred by the State of Louisiana that she derives a revenue by the imposition of charges upon all vessels entering the mouth of the Mississippi river, wherewith she supports her quarantine system and service, while the laws themselves, and the evidence in this case, show that the damages are imposed with the sole purpose of raising this revenue and without rendering, or the intention to render, any service whatever to the ships charged.

That the quarantine service is ably and intelligently conducted there can be no doubt, but this affords no reason for requiring that it should be supported by those who are under no legal obligations so to do.

For these reasons, deeming it unnecessary to consider other points raised, I am of opinion that the injunction herein issued should be maintained and perpetuated at the cost of defendant and the intervention dismissed.

Messrs. Leovy & Kruttschnitt, counsel for plaintiff, Frank C. Zacharie for defendant.

VITAL STATISTICS.

The *American Journal of the Medical Sciences* for January, contains a long and interesting paper by Dr. J. S. Billings on the registration of Vital Statistics, in which is sketched the history of registration in different countries. He remarks that the subject is one of the most important, and at the same time the most difficult, in sanitary as well as in social science, the difficulties being in part due to its apparent simplicity. "Before studying it and attempting to obtain practical results, almost everyone is disposed to think that he understands it, and is quite ready not only to undertake the duties of registrar or census superintendant, but to prepare a law or ordinance regulating the matter. After one has investigated the matter a little, and has become somewhat acquainted with the methods in use, it is not unlikely that he will suppose that he has made some remarkable discoveries of causes of error, imperfect returns, insufficient tabulations, and erroneous conclusions, and will thereupon proceed to prepare a paper criticising the work of his predecessors and proposing reform. It is probable, however, as he continues his studies, that he will find that his discoveries are not new, that there are various practical objections to his proposed improvements, and that it is much easier to confine his essay to denunciation of that which is, than to point out clearly and definitely that which ought to be, and which is at the same time practicable."

He states that the most difficult of all the problems of registration in this country is to obtain a complete record of births, in a given locality, nor can it be said that it has anywhere been completely and satisfactorily solved, referring, we presume, to the United States, since the registration of births is certainly very complete in some European countries. He considers it bad policy to require medical men to furnish reports of births under penalty. It is pointed out that no certificate as to cause of death, which is given to the nearest relative or householder for transmittal will in all cases give the cause of death accurately, and that this can only be secured by some system of confidential report, to be sent by the physician direct to the registrar, which is a strong reason for keeping the physician's certificate distinct from the one giving age, occupation, etc.

"All registration acts which are upon a proper basis presuppose also legislation providing for the determining of those who are properly qualified physicians, and for making the names of these known to the registrar. It may be said, therefore, that the registration of vital statistics depends for its efficiency, to a very large extent, upon some system of registration of physicians and midwives." Attention is called to the fact that there should be as great a correspondence as possible between the census forms and the registration forms, to obtain the best results from each, and also to the great difficulty of making reliable estimates as to the number of living population in a place for any other than a census year. Of the various methods used for estimating population between one census and another no one by itself can be relied on. "The tendency is always to overestimate the number of living population. The number of deaths in a large city is in itself a means of checking such estimate, for whenever in such a city the death rate is reported as being for a whole year less than 17 per 1,000 it may be considered as certain that either the deaths are not all reported or the population is overestimated, the latter being usually the principal source of error."

The paper is one which cannot be summarized and we have merely selected a few specimens. We should have liked to have seen a discussion of the form in which registration statistics should be published. At present there is little uniformity, and some of those published are in such a form as to be of very little value.

The Chicago *Tribune* of Jan. 13th publishes the summary of the report of Health Officer Merki, who has charge of the small-pox records of the city, with the remark that "it discloses that the authorities concealed about eight cases out of ten that occurred in the city." The total number of cases during 1882 was 3,611, of which 1,055 were treated at the hospital. The deaths in the city were 1,010, and at the pest house 282. In 1851, there were 2,997 cases and 1,180 deaths. The number of persons vaccinated in 1882 was 110,915.

The report of health officer of Utica, Dr. James G. Hunt, shows that during the year 1882 there were reported for registration in Utica, 741 births, 218 marriages, and 627 deaths, 70 of the latter being non-residents. He estimates the population at 33,923, which gives an annual mortality of 18.48. The number of deaths under one year of age was 110; between one and five, 59; between five and twenty, 64; between 20 and 60, 245. Consumption caused 106 deaths; pneumonia, 56; bronchitis, 14; cerebro spinal meningitis, 22; diphtheria, 12; scarlet fever, two; typhoid fever, ten; diarrhœal diseases, 50.

The Toronto *Canadian* says that Chief Justice Spragge of that city found a contractor laying rotten cedar blocks in a street pavement, and spoke to the inspector about it, when that official replied that the rotten blocks were as good as the others, as the holes got filled up with gravel. That inspector ought to come to New York. He could easily get a place under the Park Department, the reorganization of which has been made in the interest of the contractors.

Small-pox is raging in Salem, Va. Roanoke College has suspended in consequence, and other towns in its vicinity have quarantined against the place. In Atlanta, Ga., this disease is also said to be rapidly spreading, and among the white population.

The twelve miles of mains laid for the new water works of Madison, Wisconsin, were tested under a water pressure of 125 to 145 pounds, on October 19 and 20. Three leaks occurred on the first day and three on the second.

E. G. LOVE, Ph.D., *Gas Examiner.*

SUGG, BRAY AND SIEMENS.

MT. VERNON, O., *Jan.* 15, 1883.

To the Editor of THE SANITARY ENGINEER:

Please give me the address of Messrs. Sugg, Bray and Siemens through your paper. Their names appear in your last number on improvement in coal gas burners of high candle power, on page 129. Resp'y yours,

E. C. MCCLOY.

[Wm. Sugg & Co., Vincent Works, Westminster, London, Eng. American agents: American Meter Co., 512 West 22d st., New York.

Geo. Bray & Co., Leeds, England. American agents: W. W. Goodwin & Co., 142 Chambers st., New York.

Siemens' Patent Gas light Co., 40 Queen Victoria st., London, E. C., England.

ELECTRIC LIGHT NOTES.

The Sub-Committee of Philadelphia Councils which has under consideration the adoption of an amended ordinance reducing the tax on wires used for electrical purposes, have decided that a tax of $5 per mile shall be placed on all electrical wires above ground and $2.50 on those underground, and $2.50 per mile on telegraph and telephone wires above ground and $1 underground.

Ninety Edison lamps have been placed on the Wilhelmstrasse in Berlin.

A company has been formed for lighting a considerable area in Birmingham, Eng., by electricity. The work will be under the direct superintendence of Mr. Crompton.

The Orange, S. C., cotton mills are lighted with 100 Maxim lamps, supplied by a 100-light Weston dynamo. The light has been in use two months and gives satisfaction. As to cost, the proprietor of the mills estimates interest on the plant at $175; cost of lamps for one year, $150; fuel, $60; total, $385 per annum. The low cost of fuel is explained by the fact that the 120 horse power engine which furnishes power to the mills also runs the dynamo, and the fuel consumed for the lights is estimated on the basis of 15 horse power required for the dynamo four hours each day.

Meter-ites.

At a recent meeting of the Engineers' Club of Philadelphia, Mr. E. F. Loiseau read a paper on artificial fuel. He claims to have succeeded in making compressed fuel suitable for domestic use. The fuel is supplied in egg-shaped lumps weighing about 2 ozs. There are sixty light fuel factories in Europe, but the product is in the shape of bricks, too large for family use.

The councils of Philadelphia on January 18 elected four trustees of the gas works to succeed Messrs. McManes, Bumm, W. H. Smith and Thos. J. Smith. The following were elected: W. W. Alcorn, Thos. H. Gill, William D. Gardner, and William H. Smith who was the only one of the retiring members re-elected.

The past year Philadelphia has manufactured, according to the figures of the Gas Trust, 2,319,898,000 cubic feet of gas; 54,664 feet of street mains were laid during the year, making in all 722.3 miles of mains in the city. There are 12,923 street lamps and 101,958 consumers. The net profits during the year were $510,386.

There is considerable competition for the tar from the Philadelphia Gas Works. One firm now takes the whole amount; this is stated to be about 85,000 barrels annually, at one cent per gallon. Another competitor now offers two cents per gallon to take the whole amount and give security to the city for performance of contract, and third parties elect to take smaller amounts, 10,000 to 15,000 gallons annually. The Trust on the 16th inst. voted to ask for bids for the whole amount.

The revenue of the Parisian Company for lighting and heating by gas in the first eight months of this year amounted to £1,672,635 ($8,360,000), an increase of £642.000 on the previous year. The corresponding revenue collected in the corresponding period of 1881 was £1-544,237, showing an increase of £128,398, or 8.31 per cent. this year.

Patents.

[*It is our purpose to give in these columns every Patent granted in the United States for fixtures and appliances used in Plumbing, Sewerage, Gas Fitting and Gas Manufacture, Steam and Hot Water Heating, and Electric Lighting Apparatus, etc. This is done for the information of our readers, and not as an advertisement of the articles patented.*]

[*Printed specifications of any Patents here mentioned, together with full detail illustrations, will be sent on receipt of twenty-five cents.*]

265,256. SYSTEM OF PRODUCING AND CONTROLLING CURRENTS OF AIR FOR COOLING, WARMING, VENTILATING, &c. JOHN GAMGEE, London England. Filed Jan. 30, 1882. (No model.) Issued October 3, 1882.

Claim.—1. The combination, with a building provided with suitable air-conduits, of a tower, connected therewith, provided with means for producing ice in the upper part thereof, and for producing and maintaining a downward current of air through the same by the falling of a liquid in showers therein, and with openings connecting the interior of the tower with the conduits of the building for the ingress and egress of the air, and constructed to operate substantially as described.

2. In combination, a tower provided with an ingress-opening at its upper part and egress-openings at its lower part, a building connected thereto by said ingress and egress openings, a series of refrigerating-shelves located in the upper part of said tower and adapted to hold water to be frozen, and a spaying or showering device located beneath the bottom refrigerating-shelf and connected thereto, adapted to shower the refrigerant liquid to the bottom of the shaft after it has passed through the refrigerating-shelves, as and for the purpose set forth.

3. In combination, the shelves $q\,q$, tank b^4, connecting pipes $q^1 q^1$, water-supply pipe r^6 and tower a^4, substantially as and for the purpose set forth.

4. In combination, the shelves $q\,q$, tank b^4, connecting-pipes $q^1 q^1$, water-supply pipe r^6, showering device b^5, and tower a^4, substantially as and for the purpose set forth.

5. In combination, the shelves $q\,q$, tank b^4, connecting-pipes $q^1 q^1$, water-supply pipe r^6, showering device b^5, pipe q^3, and tower a^4, substantially as and for the purpose set forth.

6. The refrigerating-shelves $q\,q$, located in the upper part of the tower a^4, adapted to hold water, and provided with discharge gates or valves r^6, and drip-cups r^8, and pipe r^9, in combination, substantially as and for the purpose set forth.

7. The method of producing currents of air of any desired temperature by the action of a liquid falling in showers in a tower or confined space, in connection with devices adapted to change the temperature of the said currents after the entrance thereof into said tower, substantially as set forth.

8. In the method of producing currents of air by means of liquids showered or caused to fall in drops down through a tower or confined space, the employment of liquids containing in solution or charged with deodorizing or antiseptic agents, whereby the air whose circulation is induced by said falling liquid will by that same liquid be deodorized or purified, substantially as hereinbefore set forth.

9. In the hereinbefore-described system of ventilating and cooling the application and use, as both the refrigerating and the air-current producing agent, of a refrigerating-liquid such as employed in freezing or ice machines, which first exercises refrigerating action upon a cooling or ice-making device, and then is showered or caused to fall in drops through the tower or other confined space, substantially as hereinbefore set forth.

265,086. TUBE CUTTER OR EXPANDER. ABRAM C. HUNSBERGER, Portland, Pa. Filed May 17, 1882. (No model.) Issued September 26, 1882.

Claim.—The combination of the radially-grooved hollow bar A tools *a*, scroll-block *d*, and screw-threaded rod *c* with the screw-nut *g* for holding the tools *a* in engagement with the scroll of the block *d* as shown and described.

265,306. WATER, GAS, SEWER OR DRAIN PIPE. JOHN P. CULVER, Tucson, Ariz. Filed Septemper 24, 1881. (No model.) Issued October 3, 1882.

Claim.—As a new article of manufacture, an open-ended tube consisting of a sheet of metal rolled or overlapped to form the required diameter, and provided between the folds with solder suitably applied and adapted to set, thereby constituting a homogeneous solid cylinder substantially as set forth.

265,112. WATER CLOSET VALVE. HENRY S. LORD and CORNELIUS BIRKERY, Hartford, Conn., assignors to the Hartford, Sanitary Plumbing Company, same place. Filed July 12, 1882. (No model.) Issued September 26, 1882.

Claim.—1. The combination of the valve by which the flow to the bowl is opened and closed, an escape-passage from above the valve, a valve arranged to operate in connection with said escape-passage to partially close the said passage when the flow of water is admitted and open said passage when the flow is cut off, substantially as described.

2. The valve A, constructed with water-passages B into a chamber, D, the escape-passage *e*, opening into said chamber D, the valve E, arranged in said chamber and below the passage *e*, the said valve arranged to partially close the said passage *e* when the water is admitted and open said passage when the flow is cut off, substantially as described.

265,277. TILE FOR WELLS AND CISTERNS. GEORGE W. OVERALL, Memphis, Tenn. Filed May 27, 1882. (No model.) Issued October 3, 1882.

Brief.—The curbing is made in sections, the lowermost bowl-shaped, those above it tapering and ring-shaped. The joints (tongue and groove) are made tight by cement.

Claim.—1. A cistern consisting of a bowl-shaped bottom section, tubular tapering intermediate sections, and a top section, all constructed and arranged substantially as set forth.

2. The herein described cistern-curbing consisting of the bowl-shaped bottom section, A, having groove D, one or more tubular tapering intermediate sections, C, each having a tongue or flange, E, and groove F, and the top section, B, having tongue G and rim H, as and for the purpose set forth.

265,310. FLOOD VALVE FOR DRAINS. FREDERICK DYER, Camden Town, County of Middlesex, England. Filed Feb. 7, 1882. (No model.) Patented in England, Sept. 23, 1881, No. 4,115. Issued Oct. 3, 1882.

Claim.—In a flood valve for drains, the combination, with the drain A, provided with a valve seat, D, of the spherical float valve B, rigidly connected with a lever, C, bent to form a stop, C^1, whereby said valve is pivotally suspended in the drain pipe and prevented from assuming a vertical position, substantially as and for the purpose specified.

365,322. VENTILATOR. PETER H. JACKSON, San Francisco, Cal. Filed July 20, 1882. (No model.) Issued Oct. 3, 1882.

Claim.—1 In a ventilator for soil pipes, flues, etc., an outer casing and an inner casing, open at both ends and forming air passages, in combination with an intermediate casing closed at its forward end and open at its rear end, forming between itself and the inner casing a space or passage between the two air passages, and in relation with the soil pipe, flue, etc., substantially as and for the purpose herein described.

2. In a ventilator for soil pipes, flues, etc., the outer or main conical casing, A, in combination with the casing D and the central casing, F, between which and casing D a space is formed closed at the front and open at the rear, and a connecting casing, E, opening from the soil pipe or flue into the space between the casings D and F, substantially as and for the purpose herein described.

3. In a ventilator for soil pipes, flues, etc., the outer or main conical casing, A, in combination with the conical or tapering casings D and F, between the walls of which a space is formed closed in front and open at the rear, said casing F having spiral flanges *f* upon its inner surface, and a connecting casing opening from the soil pipe into the space between the casings D and F, substantially as and for the purpose herein described.

4. In a ventilator for soil pipes, flues, etc., the outer or main conical casing, A, and the interior casings D and F, between the walls of which an open space is formed, in combination with the connecting casing E, having sloping sides and a pointed or beveled front, substantially as and for the purpose herein described.

5. In a ventilator for soil pipes, flues, etc., the conical or tapering inferior casing, F, having spiral flanges *f* upon its inner surface, in combination with the surrounding tapering casing D, forming a space between its inner wall and casing F, closed in front and open behind, and a connecting casing E, joining said space with the soil pipe, substantially as herein described.

265,319. IMPLEMENT FOR CLEANING WATER CLOSET BOWLS. LEWIS O. HOWELL, JR., Philadelphia, Pa. Filed June 28, 1882. (No model.) Issued Oct. 3, 1882.

Claim.—1. An implement for cleaning the bowls of water closets, consisting of an inverted corrugated or ribbed cone constructed of flexible material, as set forth, said cone being provided at its base with a handle, substantially as shown and described.

2. In an implement of the character herein specified, corrugated or ribbed inverted cone A, bearing lip A^2, core A^1, and handle B, the whole combined and arranged to operate substantially as shown and described.

265,327. WATER METER CONNECTION. JULIUS JONSON, New York, N. Y., assignor of one-half to Julius Elson, same place. Filed Aug. 23, 1881. (No model.) Issued Oct. 3, 1882.

Claim.—The combination, with a service cock composed of a shell having a straight water way and a plug having a direct water way ranging with that in the shell, and also having water ways with that ranging with that in the shell, and leading through the head of the plug, of pipes extending from the water ways in the head of the plug and a water meter having said pipes connected, one with its water inlet and the other with its water outlet, substantially as and for the purpose specified.

265,234. APPARATUS FOR HEATING WATER FOR BOILERS, &C. GEORGE H. BABCOCK, Plainfield, N. J., and Stephen Wilcox and Nathaniel W. Pratt, Brooklyn, N. Y. assignors to the Babcock & Wilcox Company, New York, N. Y.. Filed September 3, 1881. (No model.) Issued October 3, 1882.

264,946. VAPOR STOVE. WILLIAM HESTON, Mount Union, Ohio. Filed, Aug. 18, 1882. (No model.) Issued September 26, 1882.

264,980. REGULATOR FOR ELECTRIC GENERATORS. EDWARD WESTON, Newark, N. J., assignor to the U. S. Electric Lighting Company, New York, N. Y. Filed May 8, 1882. (No model.) Issued September 26, 1882.

265,049. ELECTRIC-ARC LAMP. JOSEPH R. FINNEY, Pittsburg, Pa. Filed May 3, 1882. (No model.) Issued September 26, 1882.

265,261. PUMP. WILLIAM D. HOOKER, St. Louis, Mo. Filed Dec. 15, 1881. (No model.) Issued October 3, 1882.

265,283. WATER FILTER. LUTHER B. SANBORN, Freeport, Ill. Filed November 5, 1881. (No model.) Issued October 3, 1882.

265,284. CAR HEATING APPARATUS. DANIEL D. SEWALL, Augusta, and JAMES H. SEWALL, Portland, Me. Filed April 27, 1882. (No model.) Issued October 3, 1882.

265,292. ELECTRIC-LAMP SUPPORT. WILLIAM WHEELER, Concord, Mass. Filed February 13, 1882. (No model.) Issued October 3, 1882.

265,311. ELECTRIC LAMP AND HOLDER FOR THE SAME. THOMAS A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed Feb. 5, 1880. Renewed Aug. 14, 1882. (Model.) Patented in England Feb. 10, 1880, No. 578; in Italy Apr. 28, 1880; in Belgium Apr. 30, 1880, No. 51,155; in Victoria June 15, 1880, No. 2,842; in France June 16, 1880; No. 136,088; in India, June 23, 1880, No. 415; in Sweden, June 25, 1880; in Canada July 19, 1880; No. 11,520; in New South Wales July 26, 1880; in Queensland Aug. 3, 1880; in Austria-Hungary Aug. 30, 1880; in Portugal Sept. 22, 1880, 621; in Norway Sept. 24, 1880; in New Zealand Oct. 18, 1880, No. 484; in Russia Dec. 14, 1881; in Germany Dec. 31, 1881; No. 15,602, and in Spain Jan. 2, 1882. Issued Oct. 3, 1882.

NOTICE.—All reports or communications intended for this column, or especially for the statistical department of this journal, should be addressed to THE SANITARY ENGINEER, Box 578, Washington, D. C.

The populations in this table are calculated to the middle of the sixth half-year from the date of the taking of the last Census, that is, to March 1, 1883.

It is much to be regretted that so many cities fail to furnish weekly reports of deaths regularly. It not only spoils the table for the week, but it makes monthly comparisons very difficult. Registrars are respectfully requested to furnish reports for the weeks in which such reports have not been sent as shown by these tables, in order that monthly and quarterly summaries may be made.

Notes and Abstracts.

For the week ending January 13, in 33 United States cities containing an aggregate population of 6,671,348, there died 2,883 persons, which is equivalent to an annual death rate of 22.4 per 1,000; an increase over the two preceding weeks for which the rate was 21.3 per 1,000. In the North Atlantic cities the rate was 23.1; in the Eastern cities 24.4; in the Lake cities 19.1; in the river cities 18.1; and in the Southern, for the whites 20.6, and for the colored, 28.8 per 1,000.

Sixteen cases of cerebro-spinal meningitis are reported, scattered through every section, but mainly in the Lake Cities. Probably none of these cases belong to the true cerebro-spinal, or spotted, fever. Small-pox is increasing in Philadelphia, and 13 deaths from it are reported in New Orleans. It is prevailing in a number of smaller towns in Tennessee.

LOUISVILLE, KY.—Dr. Montgomery reports ten new cases of small-pox, with three deaths from this disease in hospital and one death in the city.

WILMINGTON, DEL.—Dr. E. B. Frazer reports 13 cases of small-pox during the week.

DETROIT, MICH.—Dr. O. W. Wight reports 41 cases of scarlet fever and 45 of diphtheria.

BALTIMORE, MD.—The total number of deaths reported during the week ending January 13 was 270, an increase of 101 over the corresponding week of 1882. Births reported during the week 138. The deaths from small-pox were 83, 21 of them adults and 62 minors. This is an increase of four over those reported the week previous, and is four less than the increase for the week before that. Of those who died, 168 were white natives of the United States, 71 colored, and 31 foreign. Died under five years of age, 105; between five and twenty years, 56; between twenty and forty, 52; between forty and sixty, 25; between sixty and eighty, 28; between eighty and ninety, three; between ninety and one hundred, one. The principal causes of death were, Small-pox 83, consumption 29, diphtheria 19, pneumonia 15, disease of the heart and scarlet fever each nine, convulsions seven, croup five, apoplexy, Bright's disease, erysipelas, typhoid fever, hemorrhage of the lungs, old age and paralysis, each four; congestion of the lungs, inflammation of the kidneys, inflammation of the tonsils and meningitis, each three; dentition, malarial fever, typhoid malarial fever, inanition, inflammation of the bronchi, malformation, marasmus, trismus, nascentium and whooping cough, each two.

There are at least 450 cases of small-pox in the city. General vaccination is now being vigorously pushed and its effects should soon become manifest in a marked diminution of the epidemic. Had this vaccination been carried out four months ago, Baltimore would now probably be free from this disease.

MICHIGAN.—Dr. Baker's report for the week ending January 6 shows the diseases in their order of prevalence to have been as follow: consumption, rheumatism, bronchitis, tonsilitis, neuralgia, intermittent fever, pneumonia and influenza. Consumption, erysipelas, measles, pneumonia and bronchitis increased in their area, while diphtheria and neuralgia considerably decreased. Diphtheria was reported present at 18 places, scarlet fever at 15 places and measles at 12 places. Small-pox was reported in Richmond, Osceola Co., and in Royalton, Berrien Co., January 4.

BOSTON, MASS.—C. E. Davis, Jr., reports 43 cases of diphtheria, 22 of scarlet fever and eight of typhoid fever. During the year 1882 there were 8,995 deaths in the city of Boston, which is equal to 21.91 per 1,000 living. Under five years 3,150. Accidents, etc., caused 414 deaths, cerebro-spinal meningitis 24, consumption 1,579, croup 117, diarrhœal diseases 950, diphtheria, 458, erysipelas 40, typhoid fever 212, malarial fevers three, scarlet fever 75, pneumonia 681, bronchitis 373, measles 25, puerperal fever 75, small-pox eight, and whooping cough 92 deaths.

MILWAUKEE, WIS.—Dr. E. W. Diercks reports 16 new cases of scarlet fever and two of diphtheria. The deaths (22 reported to date) occasioned by the burning of the Newhall Hotel are not included in the mortality table.

ROCK ISLAND, ILL.—Dr. Craig reports but one death for the week.

NEW ORLEANS, LA.—The report for the week ending January 6 shows 163 deaths; white 116, colored 47; males 82, females 81; under five years, white 18, colored nine; over 60 years, white 15, colored ten. Annual rate 38.25, of white population 37.26, of colored 41.27. Small-pox caused 11 deaths, scarlet fever two, typhoid fever three, malarial fevers six, diphtheria one, puerperal fever one, consumption 17, croup one, acute bronchitis three, pneumonia 11, pleurisy three, and accidents, etc., seven deaths.

CAMDEN, N. J.—Dr. H. F. Palm reports 12 deaths for the week ending Jan. 6. Nine of the decedents were under five years of age. One death is attributed to each of the following causes:—consumption, diphtheria, typhoid fever, scarlet fever and pneumonia.

RICHMOND, VA.—Dr. J. G. Cabell reports Jan. 13th the occurrence of five cases of small-pox during the previous two weeks.

SAVANNAH GA.—Dr. McFarland reports for the week ending Jan. 6th, a total of 15 deaths; whites, 12, colored three. Of the diseases given in our table, consumption caused the death of two white people; diarrhœal diseases and pneumonia caused one death each among the colored population. No deaths under five years are reported.

The report for the previous week (ending Dec. 30), has also been received. The deaths numbered 14; white, six, colored, eight; under five years none are reported. Among the white people, consumption caused one death, typhoid fever, one, and pneumonia two. Among the colored people, consumption caused one death, diarrhœa one, and pneumonia one death.

BUFFALO, N. Y.—Dr. Phelps report for the week ending Jan. 6, was received too late to admit of tabular insertion. There were 58 deaths, 18 of which were of children under five years. Accidents caused five deaths, cerebro-spinal meningitis, three; consumption, four; diarrhœa, two; diphtheria, two; erysipelas, three; typhoid fever, two; scarlet fever, eight; pneumonia, seven; and puerperal fever, one death.

ROCHESTER, N. Y.—Dr. Sheehan concludes his report for the month of December as follows:—

"*It is gratifying to be able to announce a decrease in the number of deaths from diphtheria during the latter half of the past month. Between the 1st and 16 ult. 14 deaths were reported from this particular cause, against six for the period intervening between the 16th and the 31st. Very few severe cases are now known to exist, yet enough to spread the disease if the efforts at isolation, so willingly practiced of late by physicians and people, are relaxed. Facts have come into the possession of the board of health which prove beyond doubt that diphtheria is carried from one house to another, both by exposed persons and infected clothing. The action of the principal who temporarily dismissed from the junior grade some very young children recently exposed to diphtheria, is highly commendable. Her conduct under the circumstances was in strict conformity with the instructions of the board of health. Apart from diphtheria, which produced the highest mortality, the city is remarkably free from contagious and infectious diseases.*"

An abstract of this report will be given when the monthly reports from certain other localities have been received.

NASHVILLE, TENN.—Dr. Richard Cheatham's report for the year 1882 shows 1,085 deaths to have occurred. White males, 252; females, 255; colored males, 282; females, 296; under one year of age, 207. Rate for white population, 17.82; for colored, 34.50. Croup caused 14 deaths; diarrhœa, 13; dysentery, 34; malarial fever, 34; scarlet fever, 16; typhoid fever, 27; cerebro-spinal fever, seven; small pox, 11; cholera infantum, 27; cholera morbus, two; whooping cough, 18; consumption, 180; bronchitis, six; pneumonia, 63; congestion of the lungs, 14; old age, 37; and violence, 45.

At a meeting of the City Board of Health, Jan. 8th, a thorough house-to-house vaccination was suggested.

LANSING, MICH.—The mortality report from this city for the year ending Dec. 31, 1882, furnished by Dr. H. B. Baker, shows 84 deaths in a population of 8,319, or 10.10 per 1,000. Of the decedents, 47 were males and 36 females; 38 were under five years of age, and 12 over 60 years. Accidents caused 56 deaths; cerebro-spinal meningitis, one; cholera infantum, eight; consumption, 9; croup, one; diarrhœa, one; diphtheria, five; erysipelas, one; intermittent fever, one; typhoid fever, two; scarlet fever, five; pneumonia, seven; congestion of lungs, one; and puerperal diseases, one death.

TORONTO, CANADA.—Consul Wm. C. Howell's reports for the week ending Jan. 13, 32 deaths and 38 births in a population or 85,000. The only diseases reported as prevalent are those attendant upon cold weather.

ONTARIO, CAN.—The Bulletin of the Provincial Board of Health for the week ending Jan. 6 shows bronchitis, influenza, anæmia, neuralgia, tonsilitis, consumption and rheumatism as the prevalent diseases. Small-pox is reported from several localities among lumber men and railroad laborers.

VERA CRUZ, MEXICO.—The report for the month of December shows 132 deaths; males 84, females 48. The births numbered only 42. Yellow fever caused 12 deaths, acute lung diseases 18, malarial diseases six, and diarrhœa and dysentery 12 deaths.

DEMERARA, BRITISH GUIANA.—Consul Philip Figyelmesy transmits the returns of the Registrar-General from Georgetown and New Amsterdam for the month of November:

GEORGETOWN.—Births 138; deaths 158; population 47,175. Malarial fevers caused five deaths, diarrhœa and dysentery 18, consumption 36, acute lung diseases three. No deaths occurred from small-pox, diphtheria, measles or whooping cough.

NEW AMSTERDAM.—Births 15; deaths 20; population 8,124. The death causes were similar to those operating in Georgetown.

BUENOS AYRES, ARGENTINE REPUBLIC.—Consul E. L. Baker reports 638 deaths during the month of October. Small-pox caused 45 of the deaths. Mr. Baker says that this disease has become so prevalent as to be epidemic, while gastric, intermittent and typhoid fevers are very general. The sanitary condition of the city continues bad, yet notwithstanding the warmer weather the public health seems to be as good as during the previous month.

RIO DE JANEIRO, BRAZIL.—Deputy Consul General James H. Murray reports 233 deaths during the week ending Dec. 9, of which 47 were caused by small-pox, 14 by pernicious fever and 35 by consumption. The recent introduction of water Into the houses of the city by the Government is expected to prove of great sanitary value.

MARANHAO, BRAZIL.—Reports for nine weeks ending Dec. 9 have been received from J. J. Tavares, U.S. Consul. During the third of these weeks, ending Oct. 28, a few cases of small-pox occurred. During the two weeks which followed the disease was reported as increasing, but no deaths were announced. In the week ending Nov. 4, there were four deaths from small-pox, and the disease was reported as taking on an epidemic character, and during the next three weeks there were respectively five, ten and 17 deaths.

PERNAMBUCO, BRAZIL.—Consul Henry L. Atherton sends reports for the weeks ending Dec. 11 and 18, eight deaths from small-pox occurred in each week. The disease has not been declared epidemic and no precautions are yet taken to prevent its spread; the patients are not even isolated.

VALPARISO, CHILE.—Vice Consul August Moller, Jr., reports 530 deaths for the month of November in a population of 120,000. Acute lung diseases caused 69 deaths, fevers 113, small-pox 37, and consumption 63 deaths. Mr. Moller transmits the following vital statistics from the twenty-second volume of the *Anuario Estactistico* of the Republic, for the year 1881. "The population of Chile on Dec. 31, 1879, was calculated to be 2,183,434 inhabitants, and on Dec. 31, 1880, 2,199,180, an increase of 15,746 against 28,405 in 1879. The number of baptisms in 1880 was 43,489 males, and 42,293 females. The deaths were 35,261 males and 34,775 females. The number of qualified voters is given at 142,133. During last autumn small-pox spread over all the country and made numerous victims. It is still very prevalent and shows no signs of abating. In 1881, 83,499 persons were vaccinated; and with the object of stimulating the public vaccinators, an order was issued entitling them to one dollar a day when called to a distance of upwards of four kilometers from their place of residence.

ENGLAND.—The return of the Registrar General for the week ending Dec. 23 gives the average mortality in 28 large towns as 27.6 per 1,000. The lowest rate 20.0 was registered in Derby, the highest 40.1 in Liverpool. The rate in London was 27.1. The 24 deaths from diphtheria in the 28 towns, included 12 in London, two in Liverpool, and two in Halifax. Small-pox caused four deaths in London and its outer ring of suburban districts, two in Newcastle-upon-Tyne, and one in Wolverhampton. In London there were 2,728 births and 2,019 deaths. Allowing for increase in population, the births exceeded by 192, and the deaths by 122, the average numbers in the corresponding weeks of the last ten years. The present high mortality rate is in large part due to an increase in acute lung diseases. There were 66 deaths from measles, 48 from scarlet fever, 12 from diphtheria, 38 from whooping cough, 25 from enteric fever, 22 from diarrhœa and dystentery, and none from typhus or simple cholera.

For the week ending Dec. 30 the average rate in the 28 towns was 249; lowest rate in Portsmouth 16.9, highest in Sunderland 37.7. In London the rate was 23.0. The 17 deaths from diphtheria in the 28 towns, included 12 in London and 3 in Manchester. Small-pox caused two deaths in London, two in Newcastle-upon Tyne, one in Nottingham, and one in Sunderland. The births in London numbered 2,132 and the deaths 1,710, the former being 161 and the latter 218 below the corresponding weeks of the past ten years. There were registered 56 deaths from measles, 47 from scarlet fever, 20 from whooping cough, one from typhus, 15 from typhoid fever, 19 from diarrhœa and dystentry, and one from simple cholera.

DUBLIN, IRELAND.—From Dr. Charles A. Cameron's report for November, we learn that the death rate which was 25.43 in October rose to 27.4. Whooping cough, typhus fever, typhoid fever and diarrhœa and dysentery were the zymotic diseases most fatal during the month, but none of them assumed serious proportions; in fact, the zymotic death rate was less than one-half of the average rate during the previous ten years.

SCOTLAND.—Consul J. A. Leonard, of Edinburgh, transmit the return of the Registrar General for the week ending Dec. 30, a summary of which is embraced in our table. The death rate in the eight principal towns was 30.1 or 5.4 above the corresponding week of the previous year. The lowest mortality was accorded in Aberdeen 22.7, the highest in Dundee and Perth 36.1 per 1,000. Whooping cough was the most fatal miasmatic disease in Glasgow and Dundee. The rate in Edinburgh was 24.4.

ST. PETERSBURG, RUSSIA.—Consul General Edgar Stanton reports 613 deaths during the week ending Dec. 16; males 332, females 281; under five years, 314; over 60 years, 65. Typhoid and scarlet fevers, diphtheria and small-pox are prevalent. Small-pox caused 23 deaths.

ROTTERDAM, NETHERLANDS.—Consul J. F. Winter's report for the week ending Dec. 23 shows 113 deaths in a population of 157,270. Eleven cases of small-pox are reported, one of which was fatal.

STOCKHOLM, SWEDEN.—Consul Elfwing reports 71 deaths for the week ending Dec. 16, in a population of 174,706. Males 35, females 36. Measles caused four deaths, scarlet fever one, typhoid fever three, whooping cough two, diphtheria three, croup one, bronchopneumonia 11, consumption 13, diarrhœa eight and violence one.

COPENHAGEN, DENMARK.—During the weeks ending Dec. 5, 12 and 19 there were 106, 100 and 113 deaths. There were in the last-named week ten cases of measles with one death, 30 of scarlet fever with one death, 13 of diphtheria with two deaths; 43 of whooping cough with two deaths, and 91 cases of acute intestinal catarrh with seven deaths.

VENICE, ITALY.—Vice Consul Wm. H. DeWolf Budd reports 79 deaths for the week ending Dec. 23. Small-pox has appeared in one of the suburbs about half a mile from the city proper; 250 cases have been reported with six deaths.

MARSEILLES, FRANCE.—The report for November shows the occurrence of 828 deaths in a population of 360,099, or 77 more than in the corresponding month of the previous year. Of the decedents 443 were males and 385 females; 236 were under five years and 210 over 60 years. Typhoid fever caused 39 deaths; measles six, whooping-cough one, scarlet fever two, small-pox 20, croup and diphtheria 38, consumption 111, bronchitis 17, pleurisy three, pneumonia 106, pulmonary congestion six, pulmonary emphysema 35, puerperal diseases nine, and violence 17 deaths. Small-pox was stationary during the month; measles, scarlet fever and typhoid fever decreased; croup and acute lung diseases greatly increased.

BRUSSELS, BELGIUM.—The Bulletin for the week ending December 23 shows the occurrence of 278 births and 167 deaths in the city and suburbs, equivalent to annual rates of 35.1 and 21.5 respectively. Deaths under five years 56. There were no deaths from scarlet fever or diphtheria. Small-pox caused three deaths, measles two, typhoid fever two, croup four, whooping-cough one, diarrhœal diseases ten, bronchitis and pneumonia 30, and consumption 22.

FOOCHOW, CHINA.—Vice-Consul J. P. Cowles, Jr., reports Nov. 30, the presence of cholera among the native population. The doctors hesitate in pronouncing the disease true cholera, although some patients have died after six hours of vomiting and purging.

BATAVIA, JAVA.—Consul Oscar Hatfield, under date Nov. 27, states that Sourabaya has now been declared free from all epidemic sickness, and that no further cholera reports will be issued by the authorities.

SINGAPORE, INDIA.—Consul A. G. Studer reports five cases of small-pox, as having occurred in the colony during the week ending Nov. 27. Two of them proved fatal.

CALCUTTA, BRITISH INDIA.—Consul General Mattson reports 338 deaths for the week ending Dec. 2. This is equal to an annual rate of 40.7. The mortality from cholera is high, 74 deaths having occurred. Fever caused 101 deaths, diarrhœa 42, tetanus 23, consumption 13 and violence 4.

MADRAS, BRITISH INDIA.—Consular Agent L. Strange reports 345 births and 304 deaths for the week ending Dec. 8. Birth rate 45.2; death rate 39.8. Small-pox caused one death and measles one; fevers 91, dysentery 21, and diarrhœa 13. No deaths from cholera are reported.

BOMBAY, INDIA.—Consul B. F. Farnham transmits reports for the weeks ending November 28 and December 5. During the former there were 415 deaths, or 55 less than the mean of the corresponding period in the preceding five years. Annual rate 26.09. Remittent fever caused 82 deaths, acute lung diseases 66, diarrhœa 18, and dysentery eight. The births numbered 332.

During the latter week there were 414 deaths and 360 births. Remittent fever caused 77 deaths, and lung diseases, diarrhœa and dysentery 59, 31, and 17, respectively.

COLOMBO, CEYLON.—Reports for the three weeks ending Nov. 25, and Dec. 2 and 9 give the deaths from small-pox as nine, three and one respectively, and the cases are 30, 11 and 21.

The report of the Registrar General of Ceylon, for the quarter ending Sept. 30, shows a large excess of births over deaths; the former numbered 17,516 the latter 12,624. In the corresponding quarter of 1881 there were 17,177 deaths. Fever occupies the first place in the mortality list, having caused 2,179 deaths; dysentery follows with 1,496 deaths. Of 88 deaths from small-pox, 68 were in the Colombo district and chiefly within the municipal area. One death is reported as having been caused by the sting of wasps.

The *Medical Record* begins its twenty-third volume by increase of size and general improvement in its appearance. It ranks foremost among the journals devoted to medicine in the United States.

We have received the New Year's number of "The Hub," a monthly journal devoted to the carriage making and accessory trades. The elegance and thorough editing of this journal are remarkable among trade journals. Its contents are classified into departments such as "Body Shop," "Smith Shop," "Paint Shop," and "Trimming Shop," each under competent practical editorship. The number before us contains several handsome colored plates drawn to scale and the whole makes a valuable publication.

Construction Notes.

We shall always be glad to receive items of interest for this column.

FORT PLAINS, N. J.—New York City parties have offered to put in water works and guarantee an adequate supply if the village will give them the proper authority.

THE APPLETON, Wis., *Post* has issued a large sheet, containing a review of the progress of that city during the past year, from which we learn that the Board of Public Works has wisely adopted a complete plan of sewerage, according to which all future sewers and drains are to be constructed. The plans were prepared by Rudolph Hering, C. E. Provision has also been made for the water supply of the city, through a contract with a private company which has begun the construction of works, taking the supply from an artesian well 440 feet deep in Potsdam sandstone. The water will be pumped directly into the mains by Worthington pumps, the motive power being both steam and water.

PHILADELPHIA, PA.—At the meeting of the Council Committee on Survey, a report was received from the subcommittee on main sewers, recommending the construction of the following sewers: The continuation of the Mill Creek sewer, from Meadow to Market streets, which is estimated will cost $48,000; one on Snyder avenue between 13th and 16th streets, to cost $18,000; on 16th street a branch sewer to the main sewer on Snyder avenue at a cost of $5,000. At foot of Vienna street, to cost $13,500; on Washington avenue from Delaware river to Tulip street to cost $7,600.

BUFFALO.—The *Commercial Advertiser* has recently noticed the progress of the new intercepting sewer work which is to be done on plans submitted by Col. George E. Waring, who has been engaged by the Sewer Commissioners as consulting engineer during the progress of the work, which is estimated to take two years. It appears that draughtsmen are engaged on the plans of the sewer, while the specifications are being prepared by Col. Waring. Bids will be advertised for in a few weeks and it is hoped to break ground as soon as the weather will permit.

PROVIDENCE, R. I.—The annual message of Mayor William S. Hayward, of Providence, R. I., reviews the city work and finances for 1882. The total funded debt on September 30, 1882, was $9,697,688.22, of which $5,500,000 is for the water works, and $997,250 for sewers. The erection of the new Corliss engine has relieved the danger of possible breaking down of the only means of supplying water. The total expenses of the water works since 1872 have been $8,740,430 and the receipts have been $2,438,191.

There are 45 miles of sewers in the city. The City Engineer, Samuel M. Gray, M. Am. Soc. C. E., is preparing plans for the disposal of sewage and will conduct experiments on the best method during the coming summer.

LANSINGBURGH, N. Y.—The Board of Trustees will soon put the matter of constructing sewers in several cross streets to popular vote. It is proposed to construct eight sewers at a total cost of $43,000, to be paid in four years, one-third assessed on property benefited, and two-thirds on the village at large.

NEW YORK.—The Building Committee of the Cotton Exchange have been instructed to reconsider the advisability of constructing the new Exchange at once.

NEW UTRECHT, L. I.—The Earle sewer bill has passed the State Legislature; it places the drains and sewers of New Utrecht and the Dykes Meadows under the charge of the town board of health.

CINCINNATI, O.—The number of building permits issued in Cincinnati during the year was 701; but these show neither the number nor value of the building erected, since they are issued only when streets are occupied and then only on a nominal valuation. This often does not amount to more than ten per cent. of the cost. From other sources the Board of trade has been able to make an approximate estimate, and in round numbers the value of buildings erected last year was $10,000,000.

(Continued on page 184.)

The publisher of THE SANITARY ENGINEER will esteem it a favor if names of persons likely to be interested in the journal are sent to him, in order that he may send them specimen copies.

Pure Sugar vs. Spurious Sugar.

In order that the public can get sugar pure and in the condition it leaves our refineries, we now put it up in Barrels and *half barrels*.

Inside each package will be found a guarantee of the purity of the contents as follows:

We hereby inform the public that our refined sugars consist solely of the product of raw sugars refined. Neither Glucose, Muriate of Tin, Muriatic Acid, nor any other foreign, deleterious or fraudulent substance whatever is, or ever has been, mixed with them. Our Sugars and Syrups are absolutely unadulterated.

Affidavit to the above effect in New York Papers of November 18th, 1878.

Consumers should order from their grocer sugar in our original packages, either half or whole barrels.

Reliable Food Products.

Great progress has been made, within a few years, in manufacturing food products, and the standard of quality has been raised to a point far beyond that which formerly obtained. We claim that this has, to a considerable extent, been due to our efforts. As the Largest Manufacturers and Dealers in the world in this line, we consider it to our interest to manufacture only PURE and WHOLESOME goods, and pack them in a tidy and attractive manner. *All goods bearing our name are guaranteed to be of superior quality, and dealers are authorized to refund the purchase price in any case where consumers have cause for dissatisfaction.* It is, therefore, to the interest of both dealers and consumers to use THURBERS' BRANDS.

H. K. & F. B. THURBER & CO.,
Importers, Manufacturers, and Dealers in all varieties of Food Products; New York, London, and Bordeaux.

NOTICE.

Our Canned Goods are put up with a special quality of tin, and most of them, being hermetically sealed while fresh at the sources of supply, preserve the fresh, natural flavors, and are REALLY FRESHER, MORE WHOLESOME AND PALATABLE than many so called "fresh" articles which are exposed for sale during considerable periods of time in city markets.

H. K. & F. B. THURBER & CO.
West Broadway, Reade and Hudson Streets, New York.

CONSTRUCTION NOTES.

(Continued from Page 183.)

BRADFORD, PA.—We clip the following from *Engineering News*: Two plans have been submitted by J. Opperman, City Engineer, to the Water Commissioners. Plan "A" includes an impounding reservoir of five million gallons capacity, located 43 feet above, and connected by a 10-inch pipe, with a distributing reservoir; a 14-inch main leads from the last to the head of Main street in the city, 217 feet below; this represents a static pressure of 94 lbs. per square inch, or deducting friction, 84 lbs. available pressure. The estimated cost of Plan "A" is $58,741.00.

The impounding reservoir in Plan "B" has its high water level 155 feet above Main street, distance $3\frac{1}{10}$ miles. With a 10-inch main this would give a static pressure of 67 lbs., deducting friction, 50 lbs. per square inch. To provide for fire service a 10,000-barrel iron tank is located on a hill 260 feet above Main street, with a six-inch supply pipe leading to present pump station, and a 10-inch pipe connecting with 10-inch main now laid on Bushnell street. Plan "B" is to cost $48,553. The distribution system is estimated to cost in addition to either of above plans $63,470.00.

The Holly Manufacturing Co. submitted a proposition to furnish a complete system of water works for $97,602, including 11 miles pipe and 60 hydrants.

As Mr. Opperman's plans propose 13 miles of pipe and 74 hydrants, the Water Commissioners recommend the adoption of Plan "A" of the latter gentleman, at a total cost of $122,211.

The population of Bradford is put down at 12,000, and 60 gallons per head are allowed them, making the demand on the works, 720,000 gallons per day.

NEW ORLEANS—The ordinance passed in 1881, granting privilege to the New Orleans Sewerage and Drainage Company, which we last week noticed as likely to be repealed by the city council, has now met that fate. The delay in beginning the work is the reason given for the repeal.

CHICAGO.—Legars & Skerry have received the contract to build the jail at Brighton for $15,000. Ruet & Coolridge are awarded the contract for the bridge over Calumet River at, 92d street, for $26,000.

LA PASSE, CAN.—Tenders for foundation and masonry for a bridge over the Ottawa River will be received by C. N. Armstrong, until Feb. 8.

NASHUA, N. H.—Committee on Highways invite proposals for iron bridge across the Nashua River. Span about 152 feet, roadway 22 feet, with sidewalk on each side.

BROOKLYN, N. Y.—The lowest bid (received by J. V. Meserole, Surveyor and Engineer, on the 13th inst.) for grading and grading Knickerbocker ave., 70 feet wide, 34 feet between curbs, from Myrtle to Flushing, about 3,500 feet was $5.25 per running foot, by Jas. H. Gillen, 314 Franklin avenue.

BROOKLYN, N. Y.—Chief Engineer Van Buren, of the Department of City Works, is having plans prepared for a new turning bridge over Newtown Creek. It will be of iron, 165 feet long and 33 feet wide, with central pier, and steel cables. The sum of $60,000 has been raised in tax levy for the bridge.

TOPEKA, KANSAS.—The following if a synopsis of bids received for sheet copper for the court house and post office.

BIDDERS.	RATE PER POUND. 24" AND 48" SHEETS, TINNED ON BOTH SIDES.		
	12 oz.	14 oz.	16 oz.
Park, Scott & Co.	$32.50	$30.00	$28.00
J. R. Michael	35.57	33.77	31.97
Hayward & Hutchinson	37.70	34.45	31.00
John Farquhar's Sons	37.50	36.50	35.50
E. F. Wagner	38.67	35.71	33.00
Bourden Copper and Brass Works	39.75	36.75	34 00
Shoemaker, Voute & Birch	40.67	37.71	35.00
C. G. Hussey & Co	40.67	37.71	35.00
Merchant & Co	40.67	37.71	35.00
Ansonia Brass & Copper Co	40.67	37.71	35.00

The bid of Park, Scott & Co., the lowest, has been accepted.

NEW YORK CITY.—Six bids for flagging sidewalks and setting curbstones on streets surrounding Fulton market, were opened by the Commissioner of Public Works on the 16th inst. The lowest was $4,790, by Morton J. McInerny.

Portland, Me., was indicted in 1881 for allowing sewer deposits to accumulate in a dock, and creating a nuisance. The city filed a demurrer, contending that a municipal corporation could not be indicted for a nuisance of that nature. The opinion of the full bench of the Superior Court, just received, sustains the indictment.

The contract for a new station house in the 22d ward of Philadelphia was awarded the 17th inst., to Joseph N. Patterson for $33,350.

The engineer of the Cincinnati Board of Public Works estimates that it would cost $717,128.20 to put the streets of that city in good repair, in 1883, and $320,000 per year to keep them so thereafter.

Mr. W. Paul Gerhard, lately with Col. George E. Waring, has resigned his position of Chief Assistant Engineer of the Drainage Construction Company of Boston, to become Chief Engineer of the Durham House Drainage Company, of this city.

In Montreal, the *Star* complains that the sidewalks are in a disgraceful condition, "thanks to the city by-law, which makes it the duty of the property holders individually to keep them in order." This seems a poor excuse. Why don't the authorities compel the individuals to do their duty? They manage this thing better in the little city of Yonkers, which bounds New York City on the north. The street commissioner there makes the property owners do their duty, and last summer nearly all the sidewalks were relaid, where the growth of trees and natural settlement had made the flag stones irregular. Indeed, as far as police and streets are concerned, many more ambitious cities could profitably take lessons from Yonkers.

The Mayor of Philadelphia has signed an ordinance making it compulsory that the Chief Engineer of the Water Works of this city shall be both a civil and mechanical engineer.

Building Intelligence.

WE solicit from each and every one of our readers information relating to projected buildings in their locality, and should be glad to receive newspaper clippings and other items of interest.

FOR SALE BY
THE SANITARY ENGINEER,
P. O. Box 3037. 140 William St., New York
Copies will be sent, postage paid, on receipt of price.

THE SIXTH VOLUME OF

THE SANITARY ENGINEER.

The sixth volume of THE SANITARY ENGINEER includes the 27 issues from June 1 to Nov. 30.

The following are a few of the many articles of permanent interest:

Illustrated descriptions of the plumbing work in the well-known residences of Messrs. Wm. K. Vanderbilt, Cornelius Vanderbilt, Ex-Gov. Samuel J. Tilden, John Sloane. Also of the "Mills Building" (the largest office building in New York) and Minot, Hooper & Co.'s Commercial Buildings. A Russian Bath Establishment in Boston and the St. James Hotel in Baltimore.

"Berlin Sewerage." An elaborate report of the system just completed, with illustrations. By M. A. Durand-Claye, Engineer-in-Chief of Bridges and Roads of Paris.

"Trap Syphonage." Report with illustration of experiments for National Board of Health. By Edw. S. Philbrick and E. W. Bowditch. Also by Col. Geo. E. Waring, Jr. Also in England by S. S. Hellyer, Esq. Interesting and valuable data.

"Coverings for Steam Pipes." Results of Some Experiments. By Mr. M. J. Bird.

"The Health of Boys' Boarding Schools." By D. F. Lincoln, M.D.

Weekly "Mortality Returns" of the leading cities in the United States, with "Notes and Abstracts" from reports of Health Officers and correspondents of the National Board of Health. There have been printed each week beginning with issue of Oct. 12.

"Tin in Canned Fruits." By Prof. Albert B. Prescott.

"Negro Mortality of Memphis." By Dr. G. B. Thornton.

"Pullman Sewerage." Abstract of paper describing it. By Benezette Williams, C.E., Engineer in charge.

"Letters to a Young Architect on Heating and Ventilation." By Dr. J. S. Billings, Surgeon, U.S.A.

A model plan for an "Improved Tenement for Working Men in New York."

"Burning of Town Refuse at Leeds. A paper by Chas. Slagg, Assistant C.E.

"The Relative Uses of Gas and Electricity." By C. Wm. Siemens, F.R.S.

"Heat, House Plumbing and Mortality." By Lewis M. Leeds.

"The Management of Heating Apparatus." By Edw. S. Philbrick, C.E.

An extract from a paper by S. S. Hellyer on the "Unsealing of Traps by Momentum"—interesting in connection with experiments made by Messrs. Philbrick and Bowditch, and Col. Geo. E. Waring.

"Water Waste Prevention."

'Regulation of Exeter Water Works." A paper by Geo. I. Deacon, M. Inst. C.E., read before Society of Arts.

"Report of Boston Committee," and report of results in Cincinnati.

"The Massachusetts Law to Prevent the Adulteration of Food and Drugs."

"Notes on Prosecutions in Great Britain."

Practical articles on "Steam Fitting and Steam Heating," by "Thermus."

An illustrated article describing the "Accommodation for the Foreign Cattle Trade" at the port of Liverpool. By Francis Vacher, M.D.

Plan of "Flush Tank for Country Residences."

"Text of the Illuminating Oils Bill for New York State."

"The Effect of Water Level on Disease." By Baldwin Latham, M.Inst., C.E.

"A Form of Specification for Steam Fitting of an Eight Story Apartment House."

"Report on Oil Testers."

An article on the "Sewerage of Brighton, England." With reports by Sir Joseph Bazalgette and J. Bailey Denton.

A series of papers on "Water Analysis," from the *Analyst.*

"Lead Poisoning." By Dr. Edw. S. Wood, Harvard Medical College.

In addition to the foregoing, there are answers to a great variety of questions on the various topics treated by THE SANITARY ENGINEER, the usual record of patents granted and the weekly reviews of questions of current interest to sanitarians, and of the condition of the Gas and Electric Light Industries. This latter feature makes the paper of real value to inventors, since the aim is to state the facts without bias for either interest. Price, bound in cloth, $3. Postage 40 cents. P. O. Box 3037. THE SANITARY ENGINEER. No. 140 William St., New York.

BARSTOW'S

Royal Garland AND Idlewild Square Base-Burners.

These stoves are made to meet the demand for Self-Feeding Base-Burners more in harmony with the prevailing tastes in house decoration.

Of stoves representing their class, none have excited more favorable comment, and enjoyed a larger share of popularity, for the short time they have been before the public, than the ROYAL GARLAND and the IDLEWILD. They have many important features peculiar to themselves, that commend them over all others.

OHN P. GILLIS, *General Agent.* 82 JOHN STREET, NEW YORK.

STEWART'S PAT. VENTILATING TRAPS

IN STONEWARE AND IRON.

Simple in construction. No Valves to get out of order. Automatic in action. Cheapest and best ever introduced. One placed as an INTERCEPTOR between house and street sewer, or Cesspool, will positively exclude foul air from any house. *WE GUARANTEE THIS.*

Price Lists and Testimonials mailed by STEWART & CO., MANHATTAN POTTERY, foot of West 18th & 19th Streets, and 312 Pearl Street, cor. Peck Slip, New York.

RECENTLY UT INTO THE **WHITE HOUSE** BY THE U. S. GOVERNMENT.

F. E. CUDELL'S

PATENT SEWER GAS AND BACKWATER TRAP

FOR

Wash Bowls, Sinks, Bath and Wash Tubs, Safe Wastes, &c.

204 *Superior Street,*

CLEVELAND, O.

This Trap is made of lead, except Dome Screw Cover and Ball, which are of hard metal.

The correct and disinterested conclusions from the tests lately made Syphonage, for the National Board of Health proves this GRAVITY ALL **S** TRAP to be the only reliable safeguard against sewer gas. Twenty-six thousand of them in use, giving full satisfaction to ominent Sanitary Engineers, Architects and Plumbers.

BEDELL'S

IMPROVED

IRON SEWER GAS

AND

BACK WATER TRAP

Is guaranteed to shut out foul gases, tide water, regurgitation and rats from entering buildings. valve and proper ventilation is indispensable. With front vent led, this Trap successfully resisted illuminating gas pressure. Tes- l by Dr. A. M. Jacobus, as experimented by Prof. Doremus, upon lock of stone and an 8-inch brick wall. Country residences, hotels d public buildings connected with drains and cesspools, are made e with my Trap. By removing cover, access is had the whole gth of the drain without cutting pipes Architects, Engineers, mbers and Builders, send for descriptive circulars. Trade sup- ed. Agents wanted. WM. BEDELL, Builder, 985 8th Ave., N.Y.

THE BOWER

EWER GAS TRAP.

A Positive Valve Seal. A Sound Water Seal.

Simple, Cheap, Effective and Durable.

Under the severest tests to which a trap could be sub- ted by a commission appointed by the National Board Health, and whose report was printed in full in THE NITARY ENGINEER, it will be seen that the BOWER RAP offered greater resistance to syphonage action than trap manufactured for sale.

The Manufacturers solicit correspondence from the lic, especially the Trade and Architects.

Will be pleased to answer any questions as to the appli- on and effectiveness of this Trap. Send for circular.

P. BOWER & CO., Manufacturers, Cleveland, O.

Every Subscriber should have one of our t BINDERS to preserve the copies of THE NITARY ENGINEER for future reference. ce, $1.00. Postage paid.

The "National" Patent Side Outlet Closet and Trap.

WITH IMPROVED FLUSH. (Registered).

Made either complete in one piece of Earthenware, or in two pieces with Basin and Trap separate

An important alteration has been made in the *flushing* arrangement of this closet. The *supply* is now placed *opposite* the *outlet*, and a *new registered fan* attached which makes the closet more effective, and with less than two gallons of water it is guaranteed to perfectly flush out the soil and thoroughly wash the inside of basin

The Most Cleanly, Durable, Effective and Cheapest Closet and Trap ever used, requires no fittings nor Machinery of any kind, and cannot get out of order.

For the perfect working of this closet a supply pipe not less than 1¼ inch must be used.

JENKINS' PATENT
(BRASS, AND IRON BODY BRASS MOUNTED,)
TE, GLOBE, ANGLE, HORIZONTAL, CHECK AND SAFETY VALVES.

The advantages these valves possess over all other gate valves, are—

1st. They do not depend on a metallic disc for a joint, but use the Jenkins' Compressible Packing.

2d. As the disc of packing wears, the inclined follower (or metal seat,) keeps the disc to its seat, making a perfect joint.

3d. Should the discs give out at any time, they can be replaced very quickly, and at a small cost.

4th. They do not have to be taken from their places to be repaired.

5th. When the valves are only partly open steam rushing through does not come in contact with the disc, so that it is impossible for the steam to wear holes through it or cut it out, as is too commonly the case with metal disc valves.

THE BRIGHTON.

There is a tendency in some quarters to demand a Hopper form of Water Closet and to ispense with what are called mechanical parts. This would be desirable, if the so-called mechanical arts did not secure advantages in the matter of a large body of water in the bowl, not otherwise btainable, without resorting to methods not everywhere applicable or sufficiently demonstrated as racticable.

The Brighton Closet here illustrated is, we believe, the best compromise yet devised between he Hellyer form on the one hand and the Hopper on the other.

By examining the sectional cut, it will be seen that the bottom of the bowl is covered with ater, while the flush and shape of the bowl is such that the trunk on the back is kept clean.

It is attractive in appearance, being all in one piece, of white earthenware.

The pipe *B*, connected with the trunk, can be run into a heated flue when desired.

These Closets have had a large sale in England during the past four years. We have had hem in use in our factory nearly two years—and we now offer them to those who prefer a different orm of Water Closet than the *Hellyer, which, by the way, does not, in a single instance, so far as we now, fail to satisfy those who have them in use.*

This will be known as

"Meyer, Sniffen & Co.'s Water Closet Apparatus No. 30."

Persons interested are invited to call at our warerooms, Nos. 46 and 48 Cliff Street, New rk, or at No. 1 Pemberton Square, Boston, and examine this and other specialties that we have ed up with water attached, including THE ROYAL PORCELAIN BATH, THE MODEL RCELAIN SLOP HOPPER, THE HELLYER CLOSET AND HOPPER, THE IOADS HOPPER, DOHERTY SELF-CLOSING COCKS, FULLER FAUCETS, etc.

MEYER, SNIFFEN & CO.

The sanitary advantages of the CRAGIE BIDET ATTACHMENT have long been recognized. It is intended to be fitted up in connection with a water closet, and saves the room required for an ordinary Bidet. It can be attached to any water closet now in use.

The undersigned have purchased of Mr. Cragie his patents and are prepared to furnish the Bidet Attachment so adjusted that they may be fitted up with any of the modern makes of water closets.

MEYER, SNIFFEN & CO.

SMALL-POX.

From East, West, North and South come reports of fresh outbreaks, or of the spread of small-pox. Our exchanges are filled with the deliberations of health officials upon the subject, and, while in many quarters an effort is made to hush the matter up, for the sake of business interests, the result usually is to increase the distrust, if not at once, at all events, for the future. What reliance, for example, can hereafter be placed on the statement of the health authorities of Chicago as to the prevalence of small-pox in that city, when we know that they have, during the last year, made false returns on this subject. And yet they seem rather inclined to boast of having done this than to be ashamed of it. Dr. Rauch, the Secretary of the State Board of Health, is reported by the Chicago *Tribune*, of the 20th ult., as saying, that it is sometimes necessary to withhold such information, and, as commending the health authorities for the course pursued. We say nothing about the morality of this sort of teaching, but we are quite sure that honesty is the best policy in the long run.

The small-pox items in the daily press contain a great deal about quarantining the disease. They have been trying this in Baltimore, and in Nashville, and now we see that the New York State Board of Health is reported as having advised that a certain number of towns in Schuyler County should be quarantined on account of small-pox. All this quarantining and placing guards over infected houses, etc., has always proved a failure when relied on as the sole means of stopping the spread of small-pox. Baltimore and Nashville have found it so, and are now proceeding to do what they ought to have done a year ago—namely, to enforce systematic vaccination of the community.

How absurd and childish a small-pox panic is. Every one has it in his power to make himself and his family almost absolutely secure from danger from this disease, by securing proper vaccination. When he has done this, he has no occasion to run away from a small-pox patient.

Take the following item from the Chicago *Tribune*, of Jan. 21, as a specimen:

(Special.) RAT PORTAGE, MANITOBA, *Jan.* 20.

Twenty lumbermen, suffering from small-pox, are expected here every moment in a car. The town is in terrible excitement. All business places are closed. None but employés are allowed within admission distance of the hotels. Mayor Oliver is swearing in special constables to protect the town. The intention is to send the sufferers on to Camp No. 2, two miles west of here, where clothes, bedding, and provisions have been placed for their use. There is only one case at present in town, which is being attended to.

The swearing in of the special constables is very good. What a fine scene in a comic opera could be made out of this.

But, while small-pox panics have their comic aspect, there is also a very dark side to the picture. This, to our mind, is not so much the death and loss caused by the disease, as it is the fact that, in this year of our Lord, 1883, in what we think is a civilized and enlightened country, there are people going about trying to persuade others not to be vaccinated and not to allow it to be done in their families, and that among the ignorant poor they succeed to a considerable extent. We are reaping the result of the seed sown among the peasantry by the anti-vaccination fanatics abroad, and, upon their heads, rests, to a large extent, the heavy mortality among our immigrant population.

What should be done with men and women who preach such fatal doctrine? It strikes us that a good insane asylum, organized on the principle that the occupants shall be made to work enough to pay all the expenses of the institution, would benefit both them and the community at large.

NEW YORK'S WATER SUPPLY.

No. II.

THE SUPPRESSION OF WASTE.

As an illustration of what may be accomplished under proper regulation to suppress water waste, we quote from an address of Mr. Thos. Hawksley, Past President of the Institution of Civil Engineers, delivered at Liverpool, in 1876:

"The necessity for the adoption of an uniform and uniformly applied system of rules and regulations, is manifested by the results of their application or otherwise in towns of a generally similar character. Oxford and Cambridge are two such towns; in the former, where no efficient regulations are in use, the quantity delivered is eighty gallons per head; in the latter, where efficient regulations are in use, the quantity delivered is eighteen gallons."

Thirty years ago, the water supply of nearly every English city was on the intermittent plan, it being supposed that under a constant service the waste would be so great that the water companies would be unable to keep up the supply. In cities therefore where a scarcity of water was imminent and with very little prospect of an early increase, attention was turned, as it never is in times of plenty, to the adoption of measures for the suppression of waste.

Digitized by Google

The means adopted in Great Britain to check waste are substantially three:

First. Intermittent supply and an inefficient inspection and supervision over fittings and plumbing work.

Second.—Testing and stamping of all fittings, rigid rules to govern the plumbing work, inspection before water is turned on, and house-to-house inspection periodically thereafter.

Third.—The Liverpool plan, which is to have district meters in the streets in order to localize the waste, rigid and persistent inspection, careful testing and stamping of every fitting used, and inspection of the plumbing work periodically thereafter.

Norwich was the first city in England to secure parliamentary powers to adopt and enforce rules controling the character of the water fittings and the plumbing. This was made necessary, as the consumption had so increased, that the intermittent supply had to be reverted to. The consumption had then risen to what in England is regarded the enormous amount of forty imperial gallons per head, daily, about forty-eight United States gallons. Under the direction of the eminent hydraulic engineer, Mr. Thos. Hawksley, parliamentary powers were sought and obtained, rules were prepared and enforced, defective mains replaced, and waste stopped to such an extent, that the consumption was brought to fifteen gallons per head, less than one-third the former amount, and the constant service was restored and has ever since been maintained.

Many other cities sought and secured the power to regulate the use of water supply fittings and control the manner of doing the plumbing work, and the essential features of the Norwich Water Works Rules are embodied in every set of water works regulations in Great Britain, while as a matter of fact hardly a single one of them obtains in any American city.

It must not be supposed that the powers to regulate these matters were easily obtained; on the contrary, they were fought inch by inch and were only secured by most persistent effort and the expenditure of large sums of money by the various companies. As an instance, we would cite the case of the adoption of the rules to govern fittings and methods of plumbing in Sheffield. The hearing before the magistrates, who by the act of Parliament were required to sanction them, continued thirteen days and cost the water company twenty thousand dollars.

In London the water is supplied entirely by private companies, and with the exception of one or two, the supply is yet intermittent. Being private corporations, they have not been able to secure such control over the fittings and the plumbing work as some of the other cities possess, due probably to the fact that powers of the kind sought are not readily granted to any but municipal authorities. The rules under which they now act were adopted about 1873, and required the sanction of the Board of Trade, who appointed as commissioners to confer with the water works' managers, the Duke of Richmond, Capt. Tyler and Mr. Robt. Rawlinson.

The original demands of the water companies were considered excessive and were strongly resisted. They were modified by the Board of Trade, and finally agreed to. Being private corporations the feeling against the water companies is much like that against gas companies. The managers, therefore, in order to prevent controversies, and relying on their intermittent service to restrict consumption, are more lax in the enforcement of their published rules, than are the authorities of Liverpool, Manchester and Glasgow. The result is, that many so-called waste-preventing devices are used in London, and winked at, that are not permitted in the other places, the effect of which, however, is to afford a market for the inventors of new things.

[To be Continued.]

With a clear perception of what stroke of enterprise would be of greatest practical benefit to its readers, the *American Architect* some time ago proposed a competition for artistic houses of so moderate cost as to be within the means of clerks and others on small salaries, or in rather narrow circumstances. By the terms of the competition the cost is not to exceed $3,000. The competition closed Jan. 13, and the editor of the *Architect* now announces that it has been successful beyond his expectations, and that a large number of plans of value have been offered them which will be published in the *Architect*. The first appears in the issue of Jan. 20. The award of prizes will be soon announced.

How slow the reform of the sanitary condition of the homes of a large city must be was indicated last week by the experience of a civil engineer, while looking for lodgings in the apartment houses of this city. He visited twelve in all, and naturally observed the plumbing pretty closely. They had all been built within two years, yet in only one were the traps ventilated against syphonage, and in only two, were the closets flushed from special cisterns. Yet, small as the improvement seems, in proportion to the vast size of the city, already it has gone far enough to give safer habitations to very considerable numbers of people. In Brooklyn, it has recently been stated, that more than 5,000 persons have been provided with sanitarily safe homes by the six months of enforcement of the plumbing law, and in this city the number is unquestionably much greater.

Gov. Butler, of Massachusetts has appointed a lawyer from Reading to succeed Dr. Chas. F. Folsom as one of the trustees of the Danvers Insane Asylum. Dr. Folsom, at personal inconvenience, gave much time to the interests of this institution. His special knowledge and experience made his services of the greatest value. Dr. Folsom will be a gainer in being relieved from his unpaid duties; the State, however will be a loser. Gov. Butler has started badly in this line.

Many people believe that kitchen slops are entirely harmless, at any rate that when poured in the cess-pool or on the ground no harm, no smells can result; but now and then they find to their dismay, that kitchen refuse, when decaying, is no less offensive than water closet wastes. Last summer a gentleman who had had such an experience, with no fault of his, however, explained how he had fared. It seemed that a drain which took only his kitchen slops emptied into a pond. The ice in the pond broke and stopped up the drain, the kitchen slops escaped from it into the ground under the house, and such a nuisance resulted as demanded rigorous action. He was obliged to dig out the polluted soil and refill with clean, dry earth. No use of disinfectants would reach the difficulty.

What the lack of proper sanitary precautions may sometimes cost a town, is shown by the experience of Bangor, Eng., where a severe epidemic of typhoid fever prevailed last summer. To meet the additional expenses thus incurred has required twenty thousand dollars, and the imposition of a half-year's rate of 3*s.* in the pound, quadruple what has been required for many years.

The utility and necessity of distinguishing in some way between the plumbers who are a credit to their trade, by honesty and capacity, and those who dishonor it by ignorance and dishonesty, is agitating the plumbers of Philadelphia, as they are now taking the first steps towards plumbers' registration. Some, we believe, look to city and State Legislatures for action which will discriminate between who may enter the trade and who may not. But the practicability of this as yet is doubtful, and in the contemplated organization of a master plumbers' association a better opportunity is offered to gain the desired object. Let this association, when it is organized, define who may be its members and who shall be excluded, and membership will become an honor and the failure to obtain it a stigma which will do much to purify the trade there of undesirable persons.

To bring medical aid quickly, in cases of sudden sickness or accident in the night, a Night Medical Service has just been organized in Brooklyn by the Health Commissioner. The police precincts are made for this purpose registry districts for such physicians as are willing to undertake the night service. On applying to the captain of the precinct the physician's name and address are entered on a list which is hung up conspicuously in the station. Then, any citizen who may need medical attendance in his family may have an officer of the police force sent for any physician he selects. With such a system extended over the entire city, the relief might afford can scarcely be over estimated.

The Asbury Park, N. J., Board of Health seems to be vigorously and successfully engaged in attacking the nuisances which such a place is particularly exposed to. To diminish as far as they can the cesspool nuisance by preventing the pouring of the kitchen slops into the ground, they have ordained that the hogheads, barrels or boxes, which are sunk into the earth for slop-receivers, shall be taken out, the openings made by their removal filled with clean, dry earth, and that the refuse which formerly went into them shall be placed in water-tight receptacles, and carted immediately away.

In a remarkable indictment the Grand Jury of Pensacola, Fla., have presented the Board of Health of that city as guilty of gross negligence in not taking proper precautions to prevent the introduction of yellow fever into Pensacola in 1882, in employing an incompetent physician at the quarantine station, in failing to take proper measures to stamp the yellow fever out after it appeared, and in suppressing information and misleading the people of Pensacola, and of other cities and neighboring States, and "for these causes," the indictment proceeds, "we consider them responsible for the loss of many valuable lives, and for incalculable injury to the business interests of the city."

Probably no more terrible arraignment has ever been made of any American sanitary authority. Yet the temperate references of the press indicate that it is just, and results from a very deep popular resentment about the shortcomings of the board.

The movement of the Hartford Steam Company to obtain such change of charter as will permit them to supply gas of cheap quality for heating is regarded with suspicion by both the gas company and the street commissioners. By the former, because they believe this the first step towards furnishing illuminating gas, by the latter, because they fear an aggravated breaking up of the streets to lay the necessary pipes. At the instance of the street commissioners the Aldermen have ordered the city attorney to apply to the State Legislature for such a change of the law as will prevent the granting of a hearing on any petition for the incorporation of a gas or steam company asking for privileges in the streets of Hartford, unless some general notice as prescribed by the Legislature is given of the proposed hearing.

To meet the great danger connected with elevator shafts of inflammable material, one of the many bills which have been introduced into the Wisconsin State Legislature to secure the safety of guests at hotels, provides that the shafts shall be of fire-proof material. For houses accommodating one hundred persons there must be at least two outside fire-proof staircases. The partiwalls must be fire-proof, and each sleeping apartment connected with the office by electric alarms. This bill also makes it compulsory to keep watchmen on duty from midnight until five o'clock in the morning. This, and other measures of similar purpose, will probably be referred to a legislative committee for report.

GENERAL STEAM SUPPLY FOR NEW YORK CITY.

HE WORK OF THE NEW YORK STEAM COMPANY.

(Continued from Page 171.)

From the area wall the system consists essentially of wo pipes, a larger one for conveying the steam to the con- nmer and a smaller one for returning the condensed vater to the station. The subdivisions of the sys- em which radiate from the station ramify in many direc- ons, pipes now being laid in Broadway from Warren reet to Bowling Green; from Broadway down Wall street Pearl; also down Pine and Fulton to Nassau, and Lib- rty street and Maiden Lane to William street; also a line the neighborhood of Ann and Beekman street. On the ther side of Broadway pipes are laid through portions of reenwich, and in Liberty, Courtland, Fulton, Vesey, arclay, Park Place and Warren streets, from Broadway Greenwich street.

These pipes are laid in a brick conduit, where they are of rge diameter, and the spaces filled with "mineral wool," e., blast furnace slag blown to a fine floss by the action steam while hot; some of the small pipes are covered a wooden log bored to receive them and prepared prevent rotting.

The pipes are placed at nearly uniform distance below e surface and little attention given to inclination or tch, simply following the grade of the ground, though voiding a sudden dip when possible.

Bends of small magnitude, sufficient to follow the con- ur of the ground or slight deflections from a right-angle street corners, made necessary by the irregular shaped ossings, are provided for by what may be called a "ball d socket" joint. It is somewhat like a flange-union, ving a convex extension on one face, with a correspond- g concave on the other, the faces being segments of a e circle, and when put together with one of the copper skets before mentioned will make a steam-tight joint.

The water of condensation which forms within the eam pipes when everything is in full operation, is said be comparatively small, but small as it may be, it is cessary to prevent its accumulation and not carry it long stances by forcing it ahead of the steam. At distances about 75 feet, or to every six house-lots, three on each le of the street, there is a special contrivance shown in gures 8 and 9, which is variously called, "Expansion int," "Service Box," "Junction" and "Compensator," and ich in fact, does more than its name implies. Its prime ject is a compensator for the expansion and contraction the iron pipes, and it also makes a suitable fitting from ich to take the house services, but in addition it is the ans of freeing the mains from water. The pipes *a a* the main flow pipes. The joint itself (*B*) is anchored d firmly fastened, and the pipes which approach and ve it are also fastened in the middle of their lengths ween it and the joints on each side of it. If now the e is warmed, *c* and *c* being fixed points, the movement d thrust of the pipes *a a*, must be toward *b*, which is o a fixed point, but as the pipes *a a* do not connect ectly with the end of *b*, but pass inside of it and connect h the copper diaphragm (*e e*), the latter yields and bends ward; allowing the whole to adjust itself to the increased gth. The expansion joints are numerous enough to vent any considerable strain on the copper of the dia- agm, the intention being not to strain the metal beyond limit of elasticity, the maximum movement when the joints are placed about 75 ft. asunder being about one inch. The copper diaphragms, which are concentrically corrugated, are reinforced on their outer sides by radial plates which fit closely at their adjoining edges, each forming a sector of a hollow circle, and having a rib or strengthening piece on the opposite side from the pressure. They move with the copper and are supported at their extremities in such a manner as to compensate for and accommodate themselves to the change in length, in fact, they are the real diaphragm of the apparatus, the purpose of the copper being merely to cover the joints between their edges and so render the whole steam tight.*

FIGURE 8.

Condensation which forms within the pipes between any two "compensators" falls into the lower side of the annular chamber and is carried into the service-pipe (*S*), if the latter is in use, and if not in use is carried to the first that is in use after filling the intervening ones to the level of the bottom of the flow pipe.

The water which is thus carried out of the main through the first services which are in use, is not carried into an engine, if one is used, nor into the heating apparatus of the house, but returned again into the return water through a steam trap; this we will try to explain with the help of Fig. 10. Within the area-wall is placed a steam trap, a modification of what is known as the "Nåson" principle, because the late Joseph Nason improved it and made a specialty of it, but which we believe was invented by Professor Mapes. This trap takes the water which is carried in through the house-service and falls through the pipe *a*, and discharges it into the return pipe, through the pipe *b*, from the point *c*, then dry steam passes through the pipe *d*, to the house.

Trap No. 2 is to return the water which is condensed within the house, and will drain pipes either above or below the level of the mains in the street.

This principle of trap, we believe, is the only one which can be applied to the system and take the water from the cellar floor or from a sub-cellar. It is thoroughly explained in Baldwin's "Steam Heating for Buildings," page 196, and is called the "pot-trap."

The initial pressure of steam from the street is admitted as far as the "house valve," beyond which is placed the "regulating valve." The object of the latter is to admit of having a reduced pressure within the building. The valve used is the "Curtis Regulating Valve," and can be adjusted to keep a nearly regular reduced pressure—say ten pounds on the house side while there are 50 or 60 in the street, fluctuations in the street not affecting the house pressure.

FIGURE 10.

After the water is thrown by the intermittent action of the traps into the main return in the street, it flows back to the station and is received into a large tank, thence to be pumped into the boilers again. The position of the tank is in the ground under the sidewalk, as at T, Fig. 1,* and a large Worthington Duplex Pump (P) sets close to it. This pump is constantly kept running and forcing the water through a system of feed pipes which lead to all the boilers. There is a contrivance which may be called an overflow or relief valve, arranged on the discharge pipe of the pump and loaded to a pressure of about 90 pounds, which allows the water from the pump to return to the tank, or a part of it to so return, should it not be all required at the boilers at any particular time. Each boiler is fed separately and independently, the feed valve being within the control of the fireman.

The fuel for the use of the boilers is elevated to the upper story and fed through chutes to each boiler. The boilers are fired by hand in the ordinary manner.

The ashes are carried away by a system of chutes running from the ash-pit to the basement. These chutes are furnished with a valve within the ash-pit and are within the control of the fireman. They are kept closed except to drop the ashes, otherwise the draft of the chimneys would pull on them, or should the forced draft be on, to prevent the air of the fan from escaping through them.

At the point marked *A*, Fig. 2, at the east end of the southeast battery of four boilers, but on the second floor, is a fan blower with a capacity of 100 M. cubic feet of

*Steam-fitters who are acquainted with the Handren & Robins' regulator, made by the Walworth Manufacturing Co., should readily understand this principle, as it is there used to support the copper diaphgram which operates the valve.

FIGURE 9.

*Figures 1 to 7 inclusive, appeared in the last number, with the first part of this article.

air in a minute. It is driven by an engine of about 20 horse power, and is to supply air to the fires in case of necessity; it is connected with the ash-pits by a suitable system of sheet iron ducts and takes its air supply directly from the surrounding air of the floor, but should the supply be tardy the window *a* can be opened.

The elevators are situated at *f* and *f*, east end of the building, and are principally for taking up fuel to the fifth floor.

An approximation of the capacity of a station is made by finding the horse power in boilers accredited to the district, a record of which is kept at Police headquarters. The capacity of the distributing mains for a district are also formulated from the same data, allowance being made for probable increase due to the advent of the new system.

The officers of the company are W. C. Andrews, President; Wm. P. Shinn, Vice President; J. A. Bostwick, Treasurer; R. E. Rockwell, Secretary; C. E. Emery Engineer and Superintendent.

COOLING AND VENTILATING THEATRES.

To the Editor of THE SANITARY ENGINEER:

The enclosed letter was handed to me lately as probably containing a problem for the consideration of ventilating engineers, and though the doctor may not be correct, with regard to the ratio of heat caused by compressing air, he raises two questions, to which I would like to get expressions of opinion from some of the correspondents of your paper, namely: 1. Does the air of a summer's night after passing over the ice and escaping into the auditorium have more or less moisture than before it entered the ice-chamber? 2. Which is the cheapest mode—the ice at ordinary prices or the power and water necessary to cool the air, other things being equal? Yours respectfully,

"T."

JAMES BARNES, Esq.

DEAR SIR.—Several evenings ago I had the pleasure of being conducted by yourself over the theatre with which you are connected and was greatly pleased at the mechanical ingenuity shown to attain comfort for the patrons; particularly the arrangement for keeping the house cool. But there is one idea which came up the evening I was there and which was mentioned several times previous to my visit, and has been discussed several times since, in my presence, by various persons, and that is the *dampness necessarily* generated by the air passing over so large amount of ice, as you do now to make it cool. I believe you said *there could not be dampness* unless certain conditions were present, which were not. Permit me to differ with you here and say that the fact of the ice melting is proof *positive* that there is moisture generated and which is taken up by the passing air and necessarily carried into the house. I have thought considerably on this subject, and my object in writing is to submit a plan which is unique and new, so far as being applied to a house as a part of the ventilation, but is not new to science or mechanics.

Every square foot of air has a certain amount of heat. Now if we take two or more cubic feet of air and compress it into one-half its former bulk, it will give up *one-half* of its latent heat; if we compress it again to one-half of its bulk, or one quarter of its former bulk, it gives up three-fourths of its heat, and so on. Compressed to one-eighth its bulk it gives up seven-eighths of its heat. Compression does not generate heat, but causes the same amount of heat to occupy smaller space and thus be made manifest.

Ten cubic feet of air compressed to one cubic foot gives up its heat, and the one cubic foot of compressed air contains no more heat than one foot of outside air. Now, if this one foot of compressed air be let loose it instantly expands and fills a space of ten cubic feet, nearly ten times as cold as the surrounding atmosphere.

It takes up its original amount of heat from the surrounding objects, or whatever it comes in contact with. Ice can and is made easily by this plan. I think it can also be used at your theatre to take the place of the ice which you now use to cool your atmosphere.

A small power could be used to compress air, the heat being taken away by surrounding the compressor tank by water. The air by its own elasticity could be made to pass into the main air flue when it should pass beyond a given pressure, and thus dilute with its own coldness the column of air passing into the house. Should the evening be cool a less pressure could be used, or should it be warm a greater pressure be used, thus having the air less or more cold according to pressure in the condenser.

The idea can, I think, be worked up to the requirements of the case and would, I am sure, be less expensive than ice, and certainly less objectionable as having no dampness.

I hope I have made myself understandable, though fear I may not have done so; but I should like very much to know what your people may think of it.

Respectfully, J. O. T., M.D.

[The plan submitted by J. O. T., M.D., in his letter to James Barnes, Esq., for cooling the air of audience rooms, deserves a few words of comment. The writer is correct in the outlines of the broad principle underlying his plan, although the method of statement of details might cause errors in practically applying his idea. If a cubic foot of air be compressed by a piston or other mechanical means, its temperature will rise. If dry air be taken at 62° F. and compressed to one-half its volume, the final temperature will be 178° F. This is not the rendering recognizable to the thermometer of any heat previously latent in the air. There is no such thing as latent heat in air, in even the same sense as there is latent heat in steam. But the rise of temperature is due to the conversion of the work of compression into units of heat in the compressed air in order that the work of the compressor may be equal to the work of the compressed.

Again, if the final volume be one-fourth of the original volume, the final temperature will be 321° F. These temperatures result from calculations based on the universally accredited formulæ of the mechanical theory of heat verified by every experimenter. Compression, therefore, *does* generate heat in the compressed air according to fixed laws, and the unqualified statement that "ten cubic feet of air compressed to one cubic foot gives up its heat, and the one cubic foot of compressed air contains no more heat than one foot of outside air" must be at once challenged. Ten cubic feet at 62° F. compressed to one cubic foot, will make a thermometer read 569° F. in the compressed volume.

But the writer had said that the "ten cubic feet at 559° *may be made to give up its heat due to compression*, and its temperature can be reduced by refrigeration, or cold water or any such means down to 62° F., so that the one cubic foot of compressed air will contain no more heat than one cubic foot of outside air," his statement would have been unassailable. Then let this foot of compressed air loose to expand into ten feet at atmospheric pressure, and the work done in expansion will lower the temperature of the expanded air, to a temperature of nearly 200° below zero, Fahrenheit. This is not exactly the same statement as to say the air is ten times as cold as the surrounding atmosphere, for while the compression to one-tenth its volume raises the temperature of air at 62° over nine times ($\frac{559}{62} = 9 +$) yet the fraction cannot be simply inverted when the air is to expand from 62° downward. Moreover, as air has no original heat of its own, but changes its temperature only by contact with solids at different temperatures, or by mixture with gases, a difficulty is introduced from this source.

It may be well at this point to look at some of the practical difficulties in the plan suggested. In the first place, compression to one-tenth of the original volume would mean that air at atmospheric pressure would have to be compressed to a gauge pressure of 133 lbs. to the square inch. This would take a very large steam cylinder to accomplish, or else so small a compressing piston that there would be difficulty in getting enough air to do any good. That may be set aside, therefore, and suppose a less compression is sought. Another point would enter here; since the air to be compressed would contain moisture in summer. The effect of this water would be to lower the final temperature of compression and to raise the final temperature of expansion. If the air be compressed to one quarter of its volume, when its gauge pressure would be 45 lbs. per square inch, and at a temperature of 140°, it would on expansion have a final temperature of 32° only. Hence, to mix this compressed and expanded air with entering air at 80°, so that the mixture might be at 70° would require one part of air at 32° to every four parts at 80° $[(80 \times 4) + 32] \div 5 = 70$. A compressing plant to furnish one-fifth of the air required in proper ventilation of an audience room, or a hospital ward would entail such an enormous expense as would be prohibitory to the idea. To renew three times per hour the air of a building $60 \times 50 \times 40$ would require a set of compressors aggregating over 150 H. P. But it would be perfectly possible by the continued compression and expansion of the same air used dry, to cool the surfaces of an air duct or of a coil over which the air for ventilation might pass. This could also be done by use of any of the so-called ice machines now used in breweries and elsewhere, and which are replacing the use of natural ice for refrigeration in a variety of processes. These depend on the absorption of heat from surfaces when they are called on to supply the work necessary to vaporize a volatile fluid, or a gas which has been liquefied by pressure. It is debatable however, in the case of theatres or similar audience rooms, which are not to be cooled continuously, whether a small machine making ice all the time for use when needed, would not be cheaper than the large machine required to cool sufficiently the surfaces for the refrigeration of *large* volumes of air. In other words, let the air be cooled by artificial ice in which cold is stored, so to speak, rather than by metallic surfaces artificially cooled, if mechanical and commercial questions alone are to be considered.

As regards the use of ice, answering question I. of the correspondent "T.", the whole matter of greater or less moisture after leaving the ice depends on the humidity of the original air. If the air is so full of moisture as to be just ready to deposit dew, the air when it leaves the ice will be drier than before. That is, there will be less moisture per cubic foot. Air loses its power to contain moisture as it becomes cooler, and the moisture which the cooled air could not hold would be deposited on the ice. On the other hand, if the original air is drier than saturated air, it will take up moisture from the ice in a limited degree, just as it would from an equal surface of water at 32°. There can be no evaporation in the sense used by the correspondent in either case, and but a limited amount of moisture will be absorbed—certainly not enough to justify the term "dampness." The fact of the melting of the ice shows that it takes heat away from the air. It shows nothing as to the absorption of moisture. This depends solely on the humidity of the air before it reaches the ice. In the case of dry air, however, the air cooled by ice has less capacity to absorb the exhaled moisture which makes the atmosphere of warm audience rooms seem oppressive. Air of this dryness had better be cooled by dry metallic surfaces. In the case of air more nearly saturated, it would make no difference. The conditions inland will be different from those prevailing on the sea shore. In reply to question II. for temporary use, and where comparatively small quantities of air are to be cooled—as, for instance, in the case of President Garfield—natural ice is the cheapest. But where large quantities of air are to be cooled and the work is to continue, and where sufficient power and the services of an engineer are available, some form of refrigerating machine would be the most economical.]

A DANGEROUS IMPLEMENT.

We regret that the plumber's torch which is pictured here should be endorsed by the *Plumber and Decorator*, of London, because it is claimed to save time in the making of wiped and burnt joints. The flame is produced by lamp cotton steeped in benzoline spirit, and we would remind our contemporary that it is commending a thing that the local authorities should not tolerate the use of in any house.

Substantially the same arrangement, used by a plumber in this city to thaw out frozen pipes, caused the burning of a tenement house, and the loss of ten lives. Any appliance that requires naphtha, gasoline, benzine, or any product of petroleum should be excluded from buildings. The replenishing of the supply of gasoline to the torch caused the fire. There is quite risk enough with the ordinary plumber's furnace without taking chances with such explosives. The use of these torches is now prohibited here.

Gas and Electricity.

Illuminating Power of Gas in New York City.

Week ending	New York Gas Light Company.	Manhattan Gas Light Company.	Metropolitan Gas Light Company.	Mutual Gas Light Company.	Municipal Gas Light Company.	Harlem Gas Light Company.
Jan. 27.....	21.80	18.44	21.28	25.71	28.84	19.27

E. G. LOVE, Ph.D., *Gas Examiner.*

GAS EXPLOSIONS IN THE STREET STEAM PIPE MAN-HOLES.

Two explosions of gas in the man-holes of the American Steam Heating and Power Company, occurred last week; the first on Friday, at the corner of Nassau and Fulton streets, followed on the next day by a similar one at Maiden Lane and Broadway. Several passers-by were slightly injured in each case and there was some destruction of property. The gas mains have been more or less disturbed by the work of the underground steam companies, particularly those of the East Side or American Company, and the odor of illuminating gas near the steam pipe man-holes has long been familiar to pedestrians. The escaping gas follows the line of the pipes and imperfectly refilled excavations, and naturally collects in the man-holes when there is nothing to drive it out. When steam is on, the heat and escaping steam forces most of it out, so that then there appears little danger of explosion; but so long as the steam is shut off for repairs, as had been the case in the American Company's pipes for several days previous to the explosions, the gas is likely to become quite dense. It was lighted in the first case by workmen of the Mutual Gas Company, who were searching for the leak with a torch, and probably in the second case by workmen of the Steam Company who were burning wood near the spot to thaw the frozen earth. No leaks in the gas pipes were found in either case near the place of the explosion.

These occurrences have suggested to the public an element of danger not generally apprehended. The leakage of gas through defects in the mains has always been a considerable item in the cost of carrying on the gas business. That this item is to be increased in certain districts seems certain considering the manner in which the mains are disturbed by the constant digging up of the streets. Just how the public in this city is to be protected from such accidents, we are unable at this time to point out. Other cities, however, should profit by our experience.

THE ELECTRIC LIGHT AT HARTFORD.

The question of the expediency of introducing the electric light for street illumination, was referred last November by the City Council of Hartford, Ct., to the Board of Street Commissioners for report. Their reply was submitted to the Council Jan. 22. They say that as regards cost they have not been able to obtain definite proposals, but from information received they are satisfied that a satisfactory arc light to burn all night would cost $1 a night for each light. To cover the territory named in the resolution, not less than twenty-four arc lights would be requisite, the cost of which for 336 nights all night would amount to $8,064. These would displace 147 gas lights, costing for same number of nights and hours $4,998, an increased cost of $3,066, or more than sixty per centum. If the 1,280 gas lamps are all displaced, the additional yearly cost to the city will be $26,700, Substituting the electric for the naphtha lights would extend this excess to the neighborhood of $30,000. The lighting of the whole city by electricity (on existing systems) would call for an annual expenditure of $75,000, or more.

The Commissioners think that the cost of the more brilliant light is in full proportion to the amount of light furnished, perhaps in greater proportion, and do not suppose that either the council or citizens generally wish to pay for an unnecessary amount of light. Such a degree of light as is needful to enable people to pass to and fro in the streets without special danger of accident by reason of darkness is all that public convenience requires, and all that the city wishes to pay for.

They believe that a system of incandescent lamps for streets and buildings will be perfected, so as to furnish electric light at a cost not exceeding that of coal gas. They also believe it best to await the perfection of devices for storing electricity for lighting purposes, rather than introduce the arc light now.

ELECTRIC LIGHT NOTES.

The lighting of the Royal Library at Brussels by electricity is reported not to have been successful. The flickering of the lamps was found very trying to the sight.

The City Council of Chicago have adopted the views of Corporation Counsel Adams that the Elevated Electric Railroad can only be built upon the petition of a majority of property owners.

One thousand one hundred and fifty-three patents were issued by the Department of Electricity of the U. S. Patent office in 1882. Of them 258 were for electric lighting, 141 for telephonic apparatus, and 110 for magneto and dynamo electric machines.

A Montreal photographer employs the Thomas-Houston electric light for taking photographs.

An electric light wire, not properly insulated, is stated to have set fire to a balcony of a cigar shop in New Orleans, the 17th ult.

Jacksonville, Fla., is discussing the introduction of the Mast system of electric lighting. The city has received an estimate placing the first cost of three towers 150 feet high with lamps and appliances at $8,000.

The electric light was used to enable the workmen who were executing the elaborately decorated ceiling of an Episcopal church in Savannah to continue their labor during the night.

Haverly's Chicago theatre will replace gas by Edison lamps. Between 1,500 and 2,000 16 candle power lamps will be used, for the stage as well as the auditorium. A tinted globe will be used.

Electricien says that experiments have recently been making for the application of the electric light to the trains of the Southern Railway of Austria, and in a few days the first electrically lighted train will be run from Vienna to Neustadt.

It is reported that a Birmingham, Eng., workman, employed by a sewerage contractor, found a number of underground telegraph cables. He placed a chain round them and hauled off three hundred yards or more of the wire and sold his trophy for old metal, interrupting the communication between England, New York, Paris, Ireland, Scotland, and other points for several hours.

The Commissioner of Public Works of Chicago has under consideration the proposition of the Western Electric Light Company to place an Edison dynamo in the City Hall, furnish 250 lights in that building for one year, and furnish 150 lights in the Washington and LaSalle street tunnels one year for $9,183.

The *Engineer* describes an electric clock for railway stations. The mechanism for giving the signals shows two discs, each pierced with 1,440 holes, arranged in spirals of twenty-four turns, with 60 holes in each turn. Small metallic pegs are inserted in the holes corresponding to any given minute and hour, and the contact of these with an electric conductor allows passage of the current for the signal. When any change is made in the time of starting trains, the pegs are shifted. One, two, three, or more successive and different signals can be given for each train.

Meter-ites.

During the season ending Dec. 31, 1882, there were, in Montreal, 13 lamps broken by carters, 94 lamps broken with sticks, stones and snow, 722 lamps turned off, 584 lamps blown out by the wind, 659 lamps stopped by frost, etc., 2,036 panes of glass broken and 12 stolen.

Astoria, L. I. is supplied by a naphtha gas at the rate of $1.50 and $1.75 per 1,000 cubic feet.

The Gas Committee of the Leeds, Eng., Town Council, has carried a resolution that the rent for gas meters shall not exceed 5 per cent. on the cost of the meters, and such other charges as will meet their redemption.

In 1882 23 mining explosions were reported in England the number of deaths reaching 241, exactly the average for the past 32 years. Of 32 warnings issued 19 were justified by subsequent events, 12 were followed within three days by the loss of 139 lives in 15 explosions, and 66 lives were lost on the fifth and sixth days after the issue of warnings, in each case these warnings denoted a continuance of dangerous changes.

A process for the utilization of waste dust from coal has been described by Mr. W. H. Cory, an English gentleman, before the Engineers' Club of Philadelphia. It consists of mixing the coal with a small percentage of fine, dry fire clay and another small percentage of silicate of soda, and submitting the block to a pressure of one ton to the square inch. The blocks are then stacked to dry and in 24 hours (the chemical action of the alumina in the clay having converted the silicate of soda into silicate of alumina or into an insoluble substance, in that time) the blocks are fit for use and are as hard as ordinary coal.

A new process of coke burning, with the recovery of the volatile products of the coal, devised by Mr. John Jameson, is described by the Newcastle *Engineer*. It consists in drawing away gases and vapors from the bottom of the coke-oven by slight but steady suction, and condensing these products in a series of cooling pipes. The bottom of the oven is perforated, and into it is introduced the end of a suction pipe. Here it communicates with the condensing pipes, from which, at intervals, the liquid products are drawn off, whilst the incondensable gas is, for the present, allowed to escape. The suction pipe is, at the Felling Works, operated by a blower. The object aimed at is to extract such valuable elements, mineral oil and ammonia, of the charge as may be taken without adversely affecting the market value of the coke, and therefore this process is not proceeded with. The suction is so managed as to cause no actual passage of air through the charge.

In an address delivered at the Washington Convention of the American Society of Engineers, the late Ashbel Welch, President of the Society, said of the effect of the present activity on human welfare that "doubtless the preponderence of effect is good, but with many drawbacks." He noticed the following one:

The rapid movement of the business of the world requires an immense amount of brain work to be done by those who direct it in each business day. The brain gets no rest, as it would have got in old times; now constantly rushing forward, not standing in its tracks, as formerly, while the man was writing down the thought of the previous instant; now furiously at work, while formerly resting while the man was going from place to place. This kept up for six or eight hours a day must soon break a man down, and has already broken down some of our ablest men. It does not mend the matter much that next summer he can spend a few weeks at the shore, or among the mountains. A man running up hill till he is out of breath is not enabled to keep on running another hour by the prospect of rest next week. A man that runs a locomotive twenty miles an hour may run all day, but if he runs sixty miles per hour, and so his brain and eye have three times as much to do per hour, he must soon stop to rest.

Undoubtedly the progress of the age, which is so largely engineering progress, does on the whole greatly increase the welfare of mankind. By making the forces of nature do the hard work, the labors of the toiling millions are lightened many fold. The laboring man now works with brain and eye more than with muscle, and his business is now to apply some principle of science. This raises him intellectually. He now has time for improvement. Comfort and refinement, and even luxury are brought within his reach. The forces of nature having become obedient to the will of man, they are made to produce for him not only plenty, but conveniences and luxuries formerly undreamt of. By the present facilities the races of men are brought into contact with each other. Those races are being assimilated, and the prejudices and hatreds of the past are fading away. Supreme power among men is more than ever in the hands of the most enlightened, and they are sending civilization and Christianity into the regions most benighted. The light of heaven is beginning to shine into the harem and the zenana. And the time seems to be hastening when there shall universally prevail "peace on earth" and "good will towards men."

S. H. Martin, Chief Inspector of the Board of Health of Philadelphia, received during 1882, 7,674 complaints, of which 1,938 were dismissed, 5,736 declared nuisances prejudicial to public health and the parties concerned notified to abate the same, of which 3,941 reported as having been complied with, and 1,791 returned as not complied with. The principal complaints were: Filthy condition of houses and rooms, 390; courts and alleys, 325; yards, 287: vacant lots, 152; horse and cow stables, 83; manure pits, 79: stagnant ponds of water, 66; slaughter houses, 39, and bone boiling and fat rending establishments 15,—*Chronicle Herald.*

The State Board of Health of West Virginia, at their meeting in Wheeling the 13th ult., passed a resolution to be forwarded to Congress commending the National Board of Health, and requesting the removal of the restrictions placed upon the Board by Congress.
